What is the flow of water in a boiler? Water is usually pumped into the tube/piping system at the bottom, and the steam is drawn off at the top. Water enters the bottom of this tube/piping at a high pressure and high velocity. In some specialized boilers, the water velocity can be as high as 100 m/s or more.

What is the economizer on a boiler? An economizer is a mechanical device that is used as a heat exchanger by preheating a fluid to reduce energy consumption. Economizer uses the heat of exhaust flue gases to raise the temperature of incoming water in the boiler. It is also known as a feedwater heater.
