Thermodynamics: An Engineering Approach, 5th Edition by Yunus A. Cengel and Michael A. Boles: Questions and Solutions

Paragraph 1:

Question: Consider a closed system that undergoes a reversible process. If the entropy of the system increases during the process, what can be said about the surroundings?

Answer: The entropy of the surroundings must decrease by an equal amount to satisfy the second law of thermodynamics.

Paragraph 2:

Question: A Carnot heat engine operates between two reservoirs at temperatures T_1 and T_2 . What is the maximum thermal efficiency of the engine?

Answer: The maximum thermal efficiency is given by $(T_1 - T_2) / T_1$.

Paragraph 3:

Question: A refrigerator removes heat from a cold reservoir at temperature T_2 and transfers it to a hot reservoir at temperature T_1 . What is the coefficient of performance of the refrigerator?

Answer: The coefficient of performance is given by $COP = Q_2 / (W)$, where Q_2 is the heat removed from the cold reservoir and W is the work done by the refrigerator.

Paragraph 4:

Question: Consider a mixture of two ideal gases. What is the molar mass of the mixture?

Answer: The molar mass of the mixture is given by the weighted average of the molar masses of the individual gases, based on their mole fractions.

Paragraph 5:

Question: What is the entropy change of a system that undergoes an isothermal reversible expansion?

Answer: The entropy change is given by $dS = dQ / T$, where dQ is the heat transferred into the system and T is the constant temperature.
