**What is a cluster point example?** A point  $a \in \mathbb{R}^n$  is said to be a cluster point of a subset  $A$  if for every  $\epsilon > 0$  we have  $(B(a; \epsilon) \cap A) \setminus \{a\} \neq \emptyset$ , where  $B(a; \epsilon) = \{x \in \mathbb{R}^n \mid \|x - a\| < \epsilon\}$ . It's easy to see that it isn't equivalent definitions. For example, by the first definition, the point 0 is a cluster point of the set  $S = \{0\} \cup [1, 2]$ , but it is not by the second one.

**What is a cluster example?** An example of cluster sampling would be a survey conducted by a company to better understand the preferences and needs of their customers. The company could divide its customer base into clusters based on age, gender, location, etc., and then select a random sample from each cluster for further analysis.

**How do you calculate total points from grades?** To calculate your current letter grade, divide the points earned by the points possible. Using the example, 380 divided by 536 equals 0.71. To turn this into a percentage multiply the answer by 100 or move the decimal point over two places. This equals 71 or 71%.

**How do you calculate cut off grade?** The cut-off grade is determined by the cost to mine a deposit, and the price that a company can sell the underlying commodity. The higher the cost to mine, the higher the cut-off grade, whereas the higher the price of the commodity the lower the cut-off grade.
