What does a compound microscope do in the laboratory? Compound Microscopes Typically, a compound microscope is used for viewing samples at high magnification (40 - 1000x), which is achieved by the combined effect of two sets of lenses: the ocular lens (in the eyepiece) and the objective lenses (close to the sample).

What is the ability to distinguish between two objects located close to each other called? Resolving power or resolution: the ability to distinguish objects that are close together. Which is better quality ceramic or porcelain tile? Both ceramic and porcelain tiles offer excellent performance in terms of resistance to wear. However, porcelain tiles have a slight edge due to their higher density and hardness, making them an excellent choice for areas that experience heavy use, such as kitchens, hallways, and entryways.

What are the disadvantages of porcelain tile?
