What are structures in C with examples? A structure is a data type that can contain unlimited numbers of NAMED sub categories (or fields). For example, a student record may contain the students, name, age, gpa, etc. Each category of information is defined by its name and type (e.g., name is a string, age is an integer).

What is data types in data structure in C? Primary data types are also known as the fundamental data types because they are pre-defined or they already exist in the C language. All the other types of data types (derived and user-defined data types) are derived from these data types. Primary data types in C are of 4 types: int, char, float, and double.

Is struct a data structure in C? Re “Is 'struct' in the C language a data type or a data structure?": A “struct” is both a data structure and a data type. A struct's name is called an “incomplete type” because the struct's name, by itself, cannot be used as a type (like “int”, “double”, “unsigned*”, etc).
