What is global dexterity how to adapt your behavior across cultures without losing yourself in the process summary? Global dexterity, a term coined by Brandeis International Business School Professor Andy Molinsky, is the ability to adapt your behavior within a foreign culture without losing yourself in the process. In other words, it's about fitting in without stepping too far outside your personal comfort zone.

How will you adapt to different cultures? One of the best ways to immerse yourself in a new culture is to participate in local customs and traditions. Whether it's trying new foods, attending a cultural festival, or learning a traditional dance, embracing these experiences can help you feel more connected to your new environment.

What does it mean to adapt yourself to a new culture? "Plunge" into your host culture and wrestle with the differences. Keep an open mind; it is natural to have preconceived ideas and beliefs that come into question while abroad. Athletic activities like team sports or taking walks may be helpful. Get to know others at your host school or organization.

Stochastic Process: Sheldon Ross Solution

Q1. Consider a Poisson process with rate λ . What is the probability that the number of events in a time interval of length t is exactly k ?

Answer: The probability of exactly k events in time t is given by the Poisson distribution:

$$P(X(t) = k) = (e^{-\lambda t} * (\lambda t)^k) / k!$$

Q2. Suppose that the interarrival times of a renewal process have an exponential distribution with parameter λ . Find the probability that the time between the fourth and fifth arrivals exceeds t .

Answer: The time between the fourth and fifth arrivals is the sum of four independent, exponentially distributed random variables. Thus, the probability that it exceeds t is:

$$P(T > t) = e^{-4\lambda t}$$

Q3. A birth-death process has birth rate λ and death rate μ . Find the steady-state probability that the population size is n .

Answer: The steady-state probabilities are given by:

$$p(n) = (1 - p(0)) * (\lambda/\mu)^n * p(0)$$

where $p(0)$ is the steady-state probability that the population size is 0:

$$p(0) = 1 / (1 + (\lambda/\mu))$$

Q4. Consider a Markov chain with transition probabilities:

$$P = \begin{bmatrix} 0.5 & 0.3 & 0.2 \\ 0.2 & 0.4 & 0.4 \\ 0.3 & 0.1 & 0.6 \end{bmatrix}$$

Find the probability that the chain starts in state 1 and ends in state 3 after two transitions.

Answer: The probability is given by the element (1,3) of the matrix P^2 :

$$P^2 = \begin{bmatrix} 0.43 & 0.36 & 0.21 \\ 0.34 & 0.36 & 0.3 \\ 0.43 & 0.24 & 0.33 \end{bmatrix}$$

$$P(X(2) = 3 \mid X(0) = 1) = 0.33$$

Q5. A stock price follows a geometric Brownian motion with drift μ and volatility σ . Find the probability that the stock price will increase by more than $x\%$ in the next year.

Answer: The probability that the stock price will increase by more than $x\%$ is given by:

$$P(S(t+1) > S(t) * (1 + x)) = 1 - N((\log((1+x)) - \mu - \sigma^2/2) / (\sigma * \sqrt{t}))$$

where $N(\cdot)$ is the cumulative distribution function of the standard normal distribution.
