**What do isotherm maps or isobar maps show?** Isobars and isotherms are both types of contour lines used to represent data on weather maps, specifically for atmospheric pressure and temperature, respectively. The similarities between isobars and isotherms are: Both are contour lines that connect points of equal value on a map.

**On what side of the low pressure center would the winds be the strongest?** In general, the strongest winds are found near the boundary between a low pressure cell and a high pressure cell, known as a front. The winds in this region are strongest because of the pressure gradient force, which is the difference in air pressure between the two cells.

**What is an isobar and an isotherm?** Complete answer: 2) In geographical terms, an isobar will be the curve joining the locations on a map where the pressure is the same. 2) In geographical terms, an isotherm will be the curve joining the locations on a map where the temperature is the same.

**How to draw isotherms and isobars?** Using a blue colored pencil, lightly draw lines connecting equal values of temperatures every 10°F. Remember, like isobars, these lines (called isotherms) are smooth and do not cross each other. You will draw lines connecting the temperatures much like you did with the sea-level pressure map.

**What are isotherms long answers?** They are imaginary lines drawn on the map joining places having the same temperature when reduced to sea level. Closely spaced isotherms indicate great range of temperature. The unit of measurement is degree (°C) Celsius or Fahrenheit.

**What is an isotherm on a map \_\_\_\_\_?** An isotherm is a line connecting locations with equal temperature. Isotherm maps show where temperatures are relatively high and low, and also where temperature changes are gradual or dramatic over a distance.
