## **What is an information system for dummies?**

**What are the fundamental goals of information system?** The goal of an information system is to transform data into information in order to generate knowledge that can be used for decision making.

**What are the fundamentals of information?** Information relies on the context and the recipient's general knowledge for its significance. Data are only the raw facts, the material for obtaining information. Information systems use data stored in computer databases to provide needed information.

**What are the three primary responsibilities of information systems?** Three basic activities—input, processing, and output—produce the information organizations need. Feedback is output returned to appropriate people or activities in the organization to evaluate and refine the input.

**What are examples of information systems in everyday life?** Other examples of IT systems include the internet, mobile phone systems, broadcast radio and TV systems, but IT is essential to many other day-to-day activities. Consider for example a visit to a supermarket. Checkout staff use an IT system to scan bar codes and obtain prices.

**What are the core functions of information systems?** Information systems are made up of five different functions: input, storage, processing, output and feedback loop.

**What role do people play in the information system?** People are involved in information systems in just about every way you can think of: people imagine information systems, people develop information systems, people support information systems, and, perhaps most importantly, people use information systems.

**What are the basic principles of information systems?** Basic principles of information system UI design are user participation, user control, interface design, information feedback, rapid system response, help system, fault tolerance and security, and interface modification.
