Theory of Computation, 4th Edition: Questions and Solutions

Question 1: Explain the concept of a Turing machine.

Answer: A Turing machine is a hypothetical model of computation that consists of an infinite tape, a read-write head, and a finite set of states. The head can move left or right on the tape and can read and write symbols on it. The machine operates by following a set of instructions that specify how it should transition between states and modify the tape based on the current state and the symbol being read.

Question 2: Describe the hierarchy of complexity classes in the Chomsky hierarchy.

Answer: The Chomsky hierarchy classifies formal languages based on the complexity of their grammars. It divides languages into four classes:

- Type 0: Recursively enumerable languages
- Type 1: Context-sensitive languages

- Type 2: Context-free languages
- Type 3: Regular languages

Each class is defined by a particular type of grammar, with Type 0 being the most complex and Type 3 being the simplest. The hierarchy shows that there is a continuum of complexity among formal languages.

Question 3: What is the Church-Turing thesis and what implications does it have?

Answer: The Church-Turing thesis states that any computation that can be carried out by any practical computing device can be carried out by a Turing machine. This implies that Turing machines are a universal model of computation, capable of representing all possible computational processes. The thesis has profound implications for computer science and artificial intelligence, suggesting that there are inherent limitations to what can be computed.

Question 4: Discuss the decidability and undecidability of problems.

Answer: A problem is decidable if there exists a Turing machine that can halt on any input and produce a correct answer. A problem is undecidable if there is no Turing machine that can always halt and produce a correct answer. The halting problem is an example of an undecidable problem, demonstrating that there are certain computational tasks that cannot be solved by algorithms.

Question 5: Explain the relationship between automata theory and formal languages.

Answer: Automata theory and formal languages are closely related. Automata theory studies mathematical models of computation known as automata, such as finite automata and pushdown automata. Formal languages define sets of strings that satisfy certain syntactic rules. By constructing automata that accept or reject languages, we can establish the decidability or undecidability of language recognition problems and explore the relationship between computation and language.
