What is the 5% rule in AP Stats? The traditional cutoff for a small p-value is 0.05, which means that there is only a 5% chance of obtaining the observed results, or something more extreme, if the null hypothesis is true. If the p-value is below this threshold, it is considered statistically significant and you can reject the null hypothesis.

It's usually means that on a sample of something (which represent 100%), only 95% of this sample are compliant with a standard or a hypothesis. 5% represents the margin of error .

What percent get a 5 on AP stats?

How to find the z score? There are three variables to consider when calculating a z-score: the raw score (x), the population mean (μ), and the population standard deviation (σ). To get the z-score, subtract the population mean from the raw score and divide the result by the population standard deviation.
