## **Earth Science Simplified: Unraveling the Mysteries with Spaulding Namowitz**

**Question 1:** What is the definition of a mineral?

**Answer:** According to Spaulding Namowitz, a mineral is a naturally occurring, inorganic substance with a definite chemical composition and a crystalline structure.

**Question 2:** Explain the three types of rocks and their characteristics.

**Answer:** Spaulding Namowitz classifies rocks into three main types: igneous, sedimentary, and metamorphic. Igneous rocks form from cooled magma, sedimentary rocks from accumulated sediments, and metamorphic rocks from existing rocks that have undergone extreme heat and pressure.

**Question 3:** What is continental drift theory, and who proposed it?

**Answer:** Continental drift theory, proposed by Alfred Wegener, suggests that the continents move over the Earth's surface. Spaulding Namowitz explains that this theory has been supported by evidence such as matching rock formations and fossils on different continents.

**Question 4:** Describe the layers of the Earth and their composition.

**Answer:** Spaulding Namowitz divides the Earth into three layers: the crust (solid), mantle (semi-solid), and core (liquid outer layer and solid inner core). The crust is made of rock, the mantle of molten rock, and the core of iron and nickel.

**Question 5:** What are the causes of earthquakes?

**Answer:** Spaulding Namowitz states that earthquakes occur when tectonic plates move suddenly, releasing energy. The energy propagates through the Earth's crust in the form of seismic waves, causing vibrations and ground movement.
