### **Subnetting a Class B Network Address**

A Class B network address provides 65,534 host addresses, which may be insufficient for large organizations. Subnetting divides a Class B network into smaller subnetworks, increasing the number of available host addresses.

### **What is Subnetting?**

Subnetting is the process of dividing a single network into smaller, more manageable subnetworks. This allows for more efficient use of IP addresses and can improve network performance.

### **Why Subnet a Class B Network?**

There are several reasons why you might want to subnet a Class B network:

- **To increase the number of available host addresses:** A Class B network provides 65,534 host addresses, which may be insufficient for large organizations. Subnetting allows you to divide the network into smaller

subnetworks, each with its own range of host addresses.

- **To improve network performance:** Subnetting can help to improve network performance by reducing the amount of traffic that is broadcast on the network. When a host sends a broadcast packet, it is sent to all hosts on the network. Subnetting divides the network into smaller subnetworks, so broadcast packets are only sent to hosts on the same subnetwork.
- **To improve security:** Subnetting can help to improve security by isolating different parts of the network from each other. This can make it more difficult for unauthorized users to access sensitive data.

## How to Subnet a Class B Network

To subnet a Class B network, you need to:

1. **Determine the number of subnetworks you need:** This will depend on the number of hosts you need to support.
2. **Choose a subnet mask:** The subnet mask determines how many bits of the IP address are used for the network address and how many bits are used for the host address.
3. **Divide the network into subnetworks:** Once you have chosen a subnet mask, you can divide the network into subnetworks. Each subnetwork will have its own network address and range of host addresses.

### Example:

Let's say you have a Class B network with the address 172.16.0.0. You need to divide the network into four subnetworks, each with 16,384 host addresses.

To do this, you would choose a subnet mask of 255.255.128.0. This subnet mask divides the network into four subnetworks:

- 172.16.0.0/17 (16,384 host addresses)
- 172.16.128.0/17 (16,384 host addresses)
- 172.16.255.0/17 (16,384 host addresses)
- 172.16.383.0/17 (16,384 host addresses)

**Who are the five pioneers of sociology and their contributions?** Answer and Explanation: The pioneers of sociology are the French and German thinkers who analyzed society in a rigorous manner.
