

CHAPTER 27 THE SUN EARTH MOON SYSTEM ANSWERS QUILLS

[Download Complete File](#)

What are the dark colored smooth plains on the Moon's surface? mare, any flat, dark plain of lower elevation on the Moon. The term, which in Latin means “sea,” was erroneously applied to such features by telescopic observers of the 17th century.

Why there is no erosion other than surface creep and erosion due to impact on the Moon because there is no? The moon has almost no erosion because it has no atmosphere. That means it has no wind, it has no weather, and it certainly has no plants. Almost nothing can remove marks on its surface once they are made.

Why Earth observers always see the same side of the moon is explained by the Moon's multiple choice question? Our Moon's period of rotation matches the time of revolution around Earth. In other words, it takes our Moon the same length of time to turn once on its axis as it takes it to go once completely around the Earth! This means that Earth observers always see the same side of the Moon (called the “nearside”).

What probe designed to study Mars present and past ability to support life? Supercam. The SuperCam on the Perseverance rover examines rocks and soils with a camera, laser, and spectrometers to seek chemical materials that could be related to past life on Mars.

What can you conclude about the dark patches on the Moon's surface brainpop? Final answer: The dark patches on the moon's surface, often called 'seas' or 'maria', are in fact sunken plains formed by ancient volcanic activity. They appear darker than the surrounding areas due to them being rich in iron and reflecting less sunlight.

What are the dark colored fairly flat areas on the Moon? Lunar maria are large, dark, basaltic plains on the moon's surface, primarily formed by ancient volcanic eruptions.

What factor causes the most erosion on Earth's surface? Liquid water is the major agent of erosion on Earth. Rain, rivers, floods, lakes, and the ocean carry away bits of soil and sand and slowly wash away the sediment.

What causes surface erosion? The main agents of erosion are water, wind and gravity. Erosion is a natural process but is often intensified by human land use practices. This leaflet explains the different types of erosion on the north coast. The north coast's high rainfall makes the region's soils vulnerable to water erosion.

What causes the erosion of rocks on Earth's surface? Weathering is the breaking down or dissolving of rocks and minerals on Earth's surface. Once a rock has been broken down, a process called erosion transports the bits of rock and minerals away. Water, acids, salt, plants, animals, and changes in temperature are all agents of weathering and erosion.

What are smooth dark plains on the Moon? The lunar maria (/ˈmæri. ʔ/ MARR-ee-ʔ; sg. mare /ˈmʔreʔ, -i/ MAR-ay, MAR-ee) are large, dark, basaltic plains on Earth's Moon, formed by lava flowing into ancient impact basins. They were dubbed maria (Latin for 'seas') by early astronomers who mistook them for actual seas.

What are the dark plains on the Moon called? When you look at the Moon, you will see dark and light areas. The dark areas are young plains called maria and are composed of basalt. The basalt flowed in and flooded the area created by a huge impact with an asteroid or comet.

What are the plains on the Moon's surface? The lunar maria (or plains), which were formed between 3.1 and 3.9 billion years ago, are the youngest geologic units on the lunar surface, except for more recent impact craters. The release of heat from large impacts caused extensive melting and extrusion of basaltic lavas on the moon.

What are the dark stains on the Moon's surface?
