What is engineering design and presentation? About the Course Students will demonstrate knowledge and skills of the design process as it applies to engineering fields. Along the way, they'll use multiple software applications and tools necessary to produce and present working drawings, solid model renderings, and prototypes.

What are the advanced engineering processes? In building an advanced engineering system, engineers and designers go through a sophisticated process of modeling, simulation, visualization, analysis, design, prototyping, testing, and lastly, fabrication.

What is the difference between graphic design and presentation design?
Graphic Design: Focuses on cohesive and aesthetically pleasing designs.
Presentation Design: Structures information to aid the speaker's flow and audience understanding.

What do you do in engineering and design? Design engineers identify complex design problems, conduct root-cause failure analyses, and anticipate production issues. They then develop innovative design solutions, evaluate options, conduct tests, and implement solutions to meet timing, product cost and reliability targets.

What is advanced engineering design? The Advanced Engineering Design Technology (DDT) program, prepares individuals to apply basic engineering principles and technical skills to the identifications and resolution of production problems in the manufacture of products.

What do advanced engineers do? Advanced engineers use their technical and managerial skills to help departments function. Typically, advanced engineers understand multiple programming languages such as Python and C++ and use these skills to build databases or intranet systems for departments.

What is an advanced engineering degree? Advanced engineering pushes the boundaries of scientific knowledge, technical skills, and innovative thinking to solve complex problems and develop technologies across various subfields of

engineering.

What do presentation designers do? A presentation designer creates the visual layout and graphic design of a presentation. They have an understanding of many different types of media, such as PowerPoint, Google Slides, and Keynote.

Forensic Stoichiometry Stumper

Question:

A forensic scientist is investigating a suspicious fire. The scientist discovers the residue of a white powder in the fireplace, along with charred remains of a wooden table. The scientist suspects that the powder may contain magnesium carbonate, a common fire accelerant. To determine this, the scientist collects a sample of the powder and measures its mass as 1.00 gram. The scientist then places the powder in a crucible and heats it strongly. The powder decomposes, releasing carbon dioxide gas and leaving behind magnesium oxide. The mass of the magnesium oxide residue is measured as 0.40 gram.

Answer:

To determine if the powder contains magnesium carbonate, the scientist can use stoichiometry. The balanced chemical equation for the decomposition of magnesium carbonate is:

According to this equation, 1 mole of magnesium carbonate decomposes to produce 1 mole of magnesium oxide and 1 mole of carbon dioxide. The molar mass of magnesium carbonate is 84.31 g/mol, and the molar mass of magnesium oxide is 40.30 g/mol.

Using these values, the scientist can calculate the moles of magnesium oxide produced:

$$0.40 \text{ g MgO} \times (1 \text{ mol MgO} / 40.30 \text{ g MgO}) = 0.010 \text{ mol MgO}$$

Since the equation shows that 1 mole of magnesium carbonate produces 1 mole of magnesium oxide, the powder must have contained 0.010 mol of magnesium

carbonate:

$$0.010 \text{ mol MgO} \times (1 \text{ mol MgCO}_3 / 1 \text{ mol MgO}) = 0.010 \text{ mol MgCO}_3$$

Finally, the scientist can convert the moles of magnesium carbonate to grams:

$$0.010 \text{ mol MgCO}_3 \times (84.31 \text{ g MgCO}_3 / 1 \text{ mol MgCO}_3) = 0.84 \text{ g MgCO}_3$$

Therefore, the 1.00 gram sample of powder contained approximately 0.84 grams of magnesium carbonate, confirming the scientist's initial suspicion that it was a fire accelerant.
