Toyota Engine Immobilizer System: Frequently Asked Questions

Q1: What is the Toyota Engine Immobilizer System?

A: The Toyota Engine Immobilizer System is a security feature designed to prevent unauthorized vehicle theft. It uses a chip embedded in the ignition key to communicate with a transponder in the vehicle's computer. If the transponder doesn't recognize the key chip, the engine will not start.

Q2: How Does the Immobilizer System Work?

A: When you insert the ignition key, the chip in the key sends a unique signal to the transponder. The transponder verifies that the signal matches the authorized key, and if so, it sends a signal to the engine control module to allow the engine to start. Without the correct key, the engine will not receive the signal and will remain immobilized.

Q3: What Happens if I Lose My Key or If It Becomes Damaged?

A: If you lose your key or it becomes damaged, you will need to obtain a replacement key from a Toyota dealer. The dealer will need to program the new key to match your vehicle's immobilizer system.

Q4: Can I Disable the Immobilizer System?

A: It is not recommended to disable the immobilizer system, as it is a crucial security feature. Disabling the system would make your vehicle more susceptible to theft.

Q5: Can Aftermarket Security Devices Interfere with the Immobilizer System?

A: Some aftermarket security devices, such as alarms and remote starters, can interfere with the immobilizer system. It is important to ensure that any aftermarket devices are compatible with the Toyota immobilizer system before installing them.

Statistics Test Inference Proportions Part V Answers

Question 1:

You have a sample of 500 people and find that 200 of them are left-handed. Test the hypothesis that the population proportion of left-handed people is 0.45. Use a significance level of 0.05.

Answer 1:

1. **Null Hypothesis:** $H_0: p = 0.45$
2. **Alternative Hypothesis:** $H_a: p \neq 0.45$
3. **Significance Level:** $\alpha = 0.05$
4. **Test Statistic:** $Z = (\hat{p} - p) / \sqrt{p(1-p)/n} = (0.4 - 0.45) / \sqrt{0.45(1-0.45)/500} = -2.36$
5. **P-value:** $P(|Z| > 2.36) = 0.0183$
6. **Conclusion:** Since the p-value (0.0183) is less than the significance level (0.05), we reject the null hypothesis. There is evidence to suggest that the population proportion of left-handed people is not 0.45.

Question 2:

A survey of 1200 adults found that 750 of them have a college degree. Is it reasonable to conclude that more than half of adults have a college degree? Use a significance level of 0.01.

Answer 2:

1. **Null Hypothesis:** $H_0: p = 0.5$
2. **Alternative Hypothesis:** $H_a: p > 0.5$
3. **Significance Level:** $\alpha = 0.01$
4. **Test Statistic:** $Z = (\hat{p} - p) / \sqrt{p(1-p)/n} = (750/1200 - 0.5) / \sqrt{0.5(1-0.5)/1200} = 3.47$
5. **P-value:** $P(Z > 3.47) = 0.00025$
6. **Conclusion:** Since the p-value (0.00025) is less than the significance level (0.01), we reject the null hypothesis. There is strong evidence to suggest that more than half of adults have a college degree.

Question 3:

Researchers believe that the average height of women in a certain population is 5 feet 6 inches. A random sample of 150 women has an average height of 5 feet 4 inches with a standard deviation of 2 inches. Can we conclude that the population average is less than 5 feet 6 inches? Use a significance level of 0.05.

Answer 3:

1. **Null Hypothesis:** $H_0: \mu = 5 \text{ feet } 6 \text{ inches} = 66 \text{ inches}$
2. **Alternative Hypothesis:** $H_a: \mu < 66 \text{ inches}$
3. **Significance Level:** $\alpha = 0.05$
4. **Test Statistic:** $t = (\bar{x} - \mu) / (s / \sqrt{n}) = (64 - 66) / (2 / \sqrt{150}) = -3.54$
5. **P-value:** $P(t < -3.54) = 0.0004$
6. **Conclusion:** Since the p-value (0.0004) is less than the significance level (0.05), we reject the null hypothesis. There is strong evidence to suggest that the population average height of women is less than 5 feet 6 inches.

Question 4:

A manufacturer claims that its light bulbs have an average lifespan of 1000 hours. A consumer group tests 200 light bulbs and finds that the average lifespan is 950 hours with a standard deviation of 50 hours. Can we conclude that the true average lifespan is less than 1000 hours? Use a significance level of 0.05.

Answer 4:

1. **Null Hypothesis:** $H_0: \mu = 1000 \text{ hours}$
2. **Alternative Hypothesis:** $H_a: \mu < 1000 \text{ hours}$
3. **Significance Level:** $\alpha = 0.05$
4. **Test Statistic:** $t = (\bar{x} - \mu) / (s / \sqrt{n}) = (950 - 1000) / (50 / \sqrt{200}) = -5.0$
5. **P-value:** $P(t < -5.0) < 0.0001$
6. **Conclusion:** Since the p-value (less than 0.0001) is less than the significance level (0.05), we reject the null hypothesis. There is strong evidence to suggest that the true average lifespan of light bulbs is less than 1000 hours.

Question 5:

Two different types of marketing campaigns are used to promote a new product. A sample of 500 potential customers is randomly divided into two groups of 250. Group A is exposed to campaign A, and Group B is exposed to campaign B. After the campaigns, it is found that 120 customers in Group A purchased the product, while 150 customers in Group B purchased the product. Test the hypothesis that the two campaigns have the same conversion rate. Use a significance level of 0.05.

Answer 5:

1. **Null Hypothesis:** $H_0: p_A = p_B$
2. **Alternative Hypothesis:** $H_a: p_A \neq p_B$
3. **Significance Level:** $\alpha = 0.05$
4. **Test Statistic:** $Z = (p_A - p_B) / \sqrt{p(1-p)(1/n_A + 1/n_B)} = (120/250 - 150/250) / \sqrt{0.5(1-0.5)(1/250 + 1/250)} = -4.0$
5. **P-value:** $P(|Z| > 4.0) = 0.00006$
6. **Conclusion:** Since the p-value (0.00006) is less than the significance level (0.05), we reject the null hypothesis. There is strong evidence to suggest that the two marketing campaigns have different conversion rates.
