What is the most common postoperative complication of cataract surgery? Cystoid Macular Edema CME is the most frequent complication after an uncomplicated cataract surgery. Its peak incidence is about 6 to 8 weeks post-operatively. Optical coherence tomography (OCT) is the standard method for diagnosis and monitoring of CME, though fluorescein angiography is considered the gold standard.

What is the complication rate of cataract surgery? Intraoperative complications during cataract surgery were uncommon, occurring in only 1.24% of 5641 patients operated on during 2022.

What are the complications of cataract surgery lens capsules? Posterior capsular opacification (secondary cataract) is a clouding of the thin membrane (lens

capsule) that surrounds your newly implanted IOL. It's a common complication of cataract surgery that can occur months or years afterward, causing fuzzy vision.

What is the most feared complication of cataract surgery? Although the incidence of endophthalmitis is only 0.13%, this remains the most feared complication of cataract surgery with a potential devastating effect.

What are the symptoms of a botched cataract surgery? Dislocated Intraocular Lens (IOL) The IOL is the artificial lens your doctor puts in your eye during surgery. It can slip out of place, causing blurred or double vision. It can also lead to more serious issues like bleeding and swelling. You may need surgery to get it back in position or to put in a new one.

What are the red flags after cataract surgery? As a general rule, worsening sight, increasing pain, redness, swelling and discharge are all symptoms or signs that should trigger a referral.

What percentage of cataract operations go wrong? Risks of surgery The risk of serious complications developing as a result of cataract surgery is estimated at around 1 in 50 cases. These can include: blurred vision. some loss of vision.

What is a rare complication of cataract surgery? After cataract surgery, you have an increased risk of retinal detachment — a serious complication that can lead to vision loss. The condition means your retina pulls away from its usual position. Retinal detachment is a rare complication — if you have symptoms, you must seek help.

What happens if a wrong lens is put in for cataract surgery? When the surgeon mistakenly selects the wrong IOL, however, the patient's vision can be very poor and can require surgical intervention (ie, lens exchange, insertion of a piggyback IOL, or keratorefractive surgery such as PRK or LASIK).

When is it too late to have cataract surgery? Although it's never too late to have a cataract removed, it is better to have cataracts removed while they are immature, as this reduces the length of surgery and the recovery time. Earlier removal also means that you avoid the significant visual impairment associated with very mature (hyper mature) cataracts.

What happens if the capsule breaks during cataract surgery? If there is a large rupture of the posterior capsule, the surgeon may implant the IOL in the ciliary sulcus. Once the IOL has been placed, gradually instil a miotic. Afterwards, remove the viscoelastic with irrigation-aspiration.

What are the red flags after cataract surgery? As a general rule, worsening sight, increasing pain, redness, swelling and discharge are all symptoms or signs that should trigger a referral.

What percentage of cataract operations go wrong? Risks of surgery The risk of serious complications developing as a result of cataract surgery is estimated at around 1 in 50 cases. These can include: blurred vision. some loss of vision.

What are common complaints after cataract surgery?

Why is my vision getting worse after cataract surgery? Inflammation in the eye can happen after cataract surgery, but it is typically harmless. Any inflammation within the eye following cataract surgery is the body's natural response to having the eye's lens removed. This reaction causes blurry vision, but your eye doctor can prescribe medication to help.
