SBR Wastewater Treatment Design Calculations

1. What is a sequencing batch reactor (SBR)? An SBR is an activated sludge wastewater treatment process that operates in a series of batch cycles. Each cycle includes stages for fill, react, settle, and decant. During the react stage, aeration and mixing occur to promote the growth of microorganisms that break down organic matter.

2. How is the volume of an SBR determined? The volume of an SBR is determined based on the wastewater flow rate, the desired hydraulic retention time

(HRT), and the operating strategy. The HRT is the average time that wastewater spends in the reactor. Common HRTs for SBRs range from 2 to 24 hours.

3. What is the surface area of an SBR? The surface area of an SBR is determined by the reactor's geometry and the operating strategy. Common surface area requirements for SBRs range from 0.5 to 1.5 square meters per cubic meter of reactor volume.

4. How is the aeration rate for an SBR determined? The aeration rate for an SBR is determined based on the mass of biodegradable organic matter to be removed and the required oxygen supply rate. Typical aeration rates range from 0.5 to 2.0 cubic meters of air per kilogram of biochemical oxygen demand (BOD).

5. How is the mixing intensity for an SBR determined? The mixing intensity for an SBR is determined based on the need to keep the solids in suspension and to provide sufficient shear stress to promote floc formation. Typical mixing intensities range from 20 to 50 watts per cubic meter of reactor volume.
