Section 18.2 Biology: Mendelian Genetics

Question 1: State Gregor Mendel's Law of Segregation.

Answer: During gamete formation, alleles for a gene separate and segregate independently, with each gamete receiving only one allele.

Question 2: Explain the concept of genetic dominance and recessiveness.

Answer: Dominance refers to the situation where one allele masks the expression of another allele. The dominant allele is fully expressed in the phenotype, while the recessive allele is only expressed in the homozygous recessive genotype.

Question 3: What is a Punnett square and how is it used in genetics?

Answer: A Punnett square is a grid used to predict the possible genotypes of offspring from a particular genetic cross. The alleles of each parent are placed along the sides of the square, and the possible offspring genotypes are determined by combining the alleles.

Question 4: Describe the difference between a homozygous and heterozygous genotype.

Answer: A homozygous genotype consists of two identical alleles for a gene, while a heterozygous genotype consists of two different alleles. Homozygous individuals only express the dominant allele if present, while heterozygous individuals express both dominant and recessive alleles.

Question 5: Calculate the probability of obtaining an offspring with a specific genotype from a particular genetic cross.

Answer: The probability of obtaining an offspring with a specific genotype can be calculated using the Punnett square. The number of desired genotypes is divided by the total number of possible genotypes from the cross.
