What are the two types of rice transplanter? The two main types of rice transplanter are the riding type and walking type. The riding type is power-driven and can usually transplant six lines in one pass; the walking type is manually driven and can usually transplant four lines in one pass.

Which rice transplanter is best?

What is the spacing for rice transplanters? Irrigate the furrows and immediately transplant seedlings by maintaining a plant to plant distance of 9 cm to ensure 33 seedlings/m². During the first 15 days after transplanting irrigation water should be allowed to pass over the beds once in 24 hours.

What is the efficiency of rice transplanter? The field capacity, field efficiency of self-propelled rice transplanter were 0.234 ha h⁻¹ , 75.16% respectively.

What is the capacity of rice transplanter? The Rice Transplanter is suitable for transplanting inbred and hybrid rice. It can transplant two (2) to six (6) seedlings per hill at a planting depth of two to six (2-6) cm, hill spacing of 12-18 cm, and row spacing of 30 cm.

What are the components of a transplanter? The self propelled paddy transplanter consists of (i) Air cooled gasoline engine (ii) Main clutch (iii) Running clutch (iv) Planting clutch (v) Seedling table (vi) Float (vii) Star wheel (viii) Accelerator lever (ix) Ground wheel (x) Handle (xi) Four bar linkage mechanism etc.

What is the principle of mechanical rice transplanter? When planting, the handle is pulled up and pushed down. With each downward stroke, the picker picks a

number of seedlings out of the mat and puts them into the mud. At the upward stroke, the transplanter is pulled towards the operator. The free wheel is simultaneously actuated to move the chain.

What are the advantages of manual rice transplanter? Advantages and Benefits of the Rice Transplanter Machine The planter ensures more yield as it is fitted with precision instruments that transplant the seedling at the correct depth and distance from each other, so each seedling gets adequate air and water supply to grow into a healthy crop.

How do you maintain a rice transplanter? Every 4-6 hours of operation, oil lubrication should be applied to each rotating part as required. After the end of each day, the rice transplanter should be cleaned, and the machine parts should be inspected for damage, deformation, looseness of the screws, and oil.

What is manual rice transplanter? Hand Cranked Rice Transplanter is a manually operated and backward walking type of machine. This rice planter is ideal for small farmers and can plant two 2 rows simultaneously. This is a flexible and very simple operated machine. Widely applicable for rice planting in small and medium fields.

What is riding-type rice transplanter? The riding-type rice transplanter (RTMRT) is designed for transplanting rice seedlings into a puddled and levelled field. It is recommended for medium to large sizes of farms.

What size are rice transplanter trays?

What is the maximum height of a rice plant? According to IRRI [11], plant height is divided into three categories, namely short (110 cm), medium (110-130 cm), and tall (>130 cm). 3.2. Leaf Area Leaf area measured at 84 day after planting and recorded different among upland rice lines.

What is the Japanese method of rice cultivation? Japanese method of rice cultivation is highly adapted in India because the method includes use of high yielding varieties of seeds. Initial raising of seedling is done in nursery and is protected from initial infections and then transferred to fields and planted in rows to make weeding easy.

What are the components of a transplanter? The self propelled paddy transplanter consists of (i) Air cooled gasoline engine (ii) Main clutch (iii) Running clutch (iv) Planting clutch (v) Seedling table (vi) Float (vii) Star wheel (viii) Accelerator lever (ix) Ground wheel (x) Handle (xi) Four bar linkage mechanism etc.

What is the basic structure of rice? The rice grain (rough rice or paddy) consists of an outer protective covering, the hull, and the rice caryopsis or fruit (brown, cargo, dehulled or dehusked rice), (Juliano and Bechtel, 1985), (Figure 2). Brown rice consists of the outer layers of pericarp, seed-coat and nucellus; the germ or embryo; and the endosperm.

What is the structure of grafting? Grafting is the act of joining two plants together. The upper part of the graft (the scion) becomes the top of the plant, the lower portion (the understock) becomes the root system or part of the trunk. Although grafting usually refers to joining only two plants, it may be a combination of several.
