

CHEMISTRY MATTER CHANGE

ANSWER KEY CHAPTER 12

[Download Complete File](#)

What is matter in chemistry answers? Anything that has mass and occupies space is called matter. A matter is made up of tiny particles called atoms. There are three states of matter. Solid, liquid, and gas. For example, table, chair, air, water, honey, etc.

Do gases flow because there are no significant forces of attraction or repulsion between gas particles? At a given temperature, all gas particles have the same average kinetic energy. A gas expands until it fills its container because its particles are in constant and uniform motion. Gases flow because there are no significant forces of attraction or repulsion between gas particles.

What is the matter answer? Anything that has mass and takes up space is known as matter. There are three states/forms of matter: solid, liquid, and gas. Example of the matter: Ice, water, air, pen, tree, oxygen gas, petrol, chalk, gold, silver, sand, etc.

What is matter in chemistry grade 12? Matter is all the “stuff” that exists in the universe. It has both mass and volume. Mass measures the amount of matter in a substance or an object. The basic SI unit for mass is the kilogram (kg). Volume measures the amount of space that a substance or an object takes up.

Do gas particles repel or attract? A gas consists of individual particles in constant and random motion. The individual particles have negligible volume. The individual particles do not attract or repel one another in any way. The pressure of the gas is due entirely to the force of the collisions of the gas particles with the walls of the container.

Do lighter particles move more slowly than heavier particles at the same temperature? The actual average speed of the particles depends on their mass as well as the temperature – heavier particles move more slowly than lighter ones at the same temperature.

Why are gases more compressible? Gases are highly compressible because they have large intermolecular spaces between the molecules. As a result, its intermolecular force of attraction is very weak. Therefore, gases are easily compressible.

What is the definition of matter in chemistry? Matter is anything that takes up space and can be weighed. In other words, matter has volume and mass. There are many different substances, or types of matter, in the universe.

What is matter in one answer? Anything that occupies space and has mass is called matter.

What is all matter in chemistry? All matter consists of atoms, which, in turn, consist of protons, neutrons and electrons. Both protons and neutrons are located in the nucleus, which is at the center of an atom. Protons are positively charged particles, while neutrons are neutrally charged.

What is matter in chemistry grade 10? All the objects that we see in the world around us, are made of matter. Matter makes up the air we breathe, the ground we walk on, the food we eat and the animals and plants that live around us. Even our own human bodies are made of matter!
