True Solution: Uncovering the Mysteries

Question: What is a true solution?

Answer: A true solution is a homogeneous mixture of two or more substances that are completely dissolved and cannot be separated by physical means. The solute (dissolved substance) is evenly distributed throughout the solvent (dissolving

substance).

Question: What are the characteristics of a true solution?

Answer: True solutions are characterized by their:

- **Homogeneity:** The solution appears uniform throughout, with no visible particles or precipitates.
- **Clarity:** The solution is clear and transparent, allowing light to pass through without scattering.
- **Stability:** The solution remains homogeneous over time, without settling or separating.

Question: How are true solutions formed?

Answer: True solutions form when the solute particles dissolve into the solvent and distribute evenly. This occurs when the solvent molecules can effectively surround and separate the solute particles. The strength of the intermolecular forces between the solute and solvent molecules determines the extent of dissolution.

Question: What is the difference between a true solution and a colloid or suspension?

Answer: True solutions are distinct from colloids and suspensions, which are heterogeneous mixtures. Colloids contain larger particles that are suspended in the solvent but do not dissolve completely. Suspensions have even larger particles that settle out over time.

Question: What are some examples of true solutions?

Answer: True solutions include:

- Sugar dissolved in water
- Salt dissolved in water
- Alcohol dissolved in water
- Air (a mixture of nitrogen, oxygen, and other gases)
- Blood plasma (a mixture of proteins, salts, and other substances)
