- Visiting historical sites or museums related to the Civil War.
- Discussing the relevance of the project to current events and social issues.

What are the effects of volcanic eruption Class 9? Their violent eruption causes Earthquakes, flash floods, mudslide and rockfall. Lava thrown out can travel very far and burn, bury, or damage anything in its path. A large amount of dust which consists of harmful heavy metals, ash and soot particles, makes breathing hard and has a heavy toll on health.

Which type of volcano has gently sloping sides and is not explosive? Shield volcanoes Where a volcano produces low viscosity, runny lava, it spreads far from the source and forms a volcano with gentle slopes: a shield volcano. Most shield volcanoes are formed from fluid, basaltic lava flows. Mauna Kea and Mauna Loa are shield volcanoes.

What type of volcano is explosive and has very steep sides of the volcano? Some of the Earth's grandest mountains are composite volcanoes--sometimes called stratovolcanoes. They are typically steep-sided, symmetrical cones of large dimension built of alternating layers of lava flows, volcanic ash, cinders, blocks, and bombs and may rise as much as 8,000 feet above their bases.

Can shield volcanoes be explosive if water is introduced to the eruption? Eruptions at shield volcanoes are only explosive if water somehow gets into the vent, otherwise they are characterized by low-explosivity fountaining that forms cinder cones and spatter cones at the vent, however, 90% of the volcano is lava rather than pyroclastic material.

What are 3 effects of the eruption? Volcanic eruptions produce spectacular fire fountains, incandescent lava flows, clouds of ash, or bubbling mud pools.

What are 4 good effects of volcanic eruption? Volcanoes can provide people with many benefits such as: volcanic rock and ash provide fertile land which results in a higher crop yield for farmers. tourists are attracted to the volcano, which increases money to the local economy. geothermal energy can be harnessed, which provides free electricity for locals.

Which type of volcano is most explosive? Not surprisingly, supervolcanoes are the most dangerous type of volcano. Supervolcanoes are a fairly new idea in volcanology. The exact cause of supervolcano eruptions is still debated, however, scientists think that a very large magma chamber erupts entirely in one catastrophic explosion.

What are the 4 types of volcanoes? Composite cones, shield volcanoes, cinder cones and supervolcanoes are some of the types of volcanoes formed. Composite cones are tall, cone shaped volcanoes that produce explosive eruptions. Shield

volcanoes form very large, gently sloped volcanoes with a wide base. Cinder cones are the smallest volcanic landform.

What are the 7 types of volcanic eruptions?

What is the rarest type of volcano?

What is a large volcano with gently sloping sides called? Although shield volcanoes are the largest volcanoes on Earth, they do not form soaring mountains with conical peaks like composite volcanoes. Instead, they are broad volcanoes with gentle slopes and are shaped somewhat like a warrior's shield lying flat on the Earth.

What is a steep sided volcano type composed of intermediate lava flows at convergent boundaries? Composite volcanoes are also called stratovolcanoes. This is because they are formed by alternating layers (strata) of magma and ash (Figure below). The magma that creates composite volcanoes tends to be thick. The steep sides form because the lava cannot flow too far from the vent.

What causes a shield volcano to be shape like a broad dome? It is formed by the eruption of highly fluid (low viscosity) lava, which travels farther and forms thinner flows than the more viscous lava erupted from a stratovolcano. Repeated eruptions result in the steady accumulation of broad sheets of lava, building up the shield volcano's distinctive form.

Why are shield volcanoes wider than composite volcanoes? Shield volcanoes are wider than composite volcanoes because they are built from highly fluid lava flows that spread out over large areas.

What is the description of a composite volcano? Composite volcanoes are tall, symmetrically shaped, with steep sides, sometimes rising 10,000 feet high. They are built of alternating layers of lava flows, volcanic ash, and cinders. Famous composite volcanoes include Mount Fuji in Japan, Mount Shasta and Mount Lassen in California, Mount St.

Where is the best place to be during a pyroclastic flow? Pyroclastic density currents are most hazardous on, and immediately surrounding, the volcanic edifice. The best way to keep safe from is keep distant from the mountain during periods of unrest, when authorities are concerned about possible eruption.

What word describes the biggest eruption? The strongest types of eruptions, with a VEI of 8, are so-called "Ultra-Plinian" eruptions, such as the one at Lake Toba 74 thousand years ago, which put out 2800 times the material erupted by Mount St. Helens in 1980.

How many people died due to volcanoes?

What are 6 negative effects of volcanoes? Several hazards may affect the area around the volcano, such as lava flows, pyroclastic flows, lahars, jökulhlaups and landslides or debris avalanches. Volcanic activity also produces hazards that can affect areas far from the volcano, such as tephra or ash falls, releases of gas and tsunamis.

What are the 13 parts of a volcano?

What are two types of effects of volcanic eruption?

What are 5 harmful effects of volcanic eruption to people?

What effect does volcanic eruption have on humans? If inhaled, volcanic ash can cause breathing problems and damage the lungs. Inhaling large amounts of ash and volcanic gases can cause a person to suffocate. Suffocation is the most common cause of death from a volcano. Volcanic ash is very difficult to clean up.

What are the three main causes of volcanic eruptions?

What usually happens during a volcanic eruption? A volcanic eruption is the expulsion of gases, rock fragments, and/or molten lava from within the Earth through a vent onto the Earth's surface or into the atmosphere.
