**What is the ETL process in a data warehouse?** Extract, transform, and load (ETL) is the process of combining data from multiple sources into a large, central repository called a data warehouse. ETL uses a set of business rules to clean and organize raw data and prepare it for storage, data analytics, and machine learning (ML).

**What are the three types of data in a data warehouse?**

**What are the 5 key components of a data warehouse?** A typical data warehouse has four main components: a central database, ETL (extract, transform, load) tools, metadata, and access tools.
