**Why did Ford stop making C-MAX?** Ford is dropping the Grand C-Max, shown, because of a sharp drop in demand as customers switch to SUVs and crossovers. Ford confirmed it will end production of its C-Max minivan at its factory in Saarlouis, Germany, but said the plant will stay open with further investment in the Focus car that is also built there.

**What are the common faults on a Ford C-Max?**

**Is Ford C-Max economical?** With its range of efficient engines, running a C-MAX should prove fairly painless. The most efficient C-MAX in the range is the 118bhp 1.5 TDCi diesel manual with WLTP-rated fuel consumption of up to 48.7mpg. **Is C-MAX better than S-Max?** If you're still faced with the challenge of which model to buy, you should also consider the type of driving you'll be doing and how much kit you need. Overall, the S-Max offers a more well-rounded option, but the C-Max and Grand C-Max variants can be more affordable and are just as good for town drivers.

**What is an MPV car?** The meaning of 'MPV' is 'Multi-Purpose Vehicle', a term that refers to cars designed to provide optimum practicality and comfort for a large number of passengers. Also commonly referred to as people carriers, MPV cars can have from five to nine seats, making them ideal for accommodating big families or groups.

**What causes adrenal gland disorders?** Adrenal gland disorders are caused by problems with one or both adrenal glands or by problems with other glands, such as the pituitary gland. Specific disorders can develop when the adrenal glands produce too few or too many hormones, or when too many hormones are introduced from an outside source.

**What disease is the result of adrenal cortex degeneration?** Destruction or dysfunction of the adrenal cortex mainly causes glucocorticoid and mineralocorticoid deficiency. Primary adrenal insufficiency is also known as autoimmune adrenalitis or Addison disease.

**What is the major disorder of the adrenal medulla?** The adrenal medulla secretes catecholamines (epinephrine, norepinephrine, dopamine). The catecholamines help prepare the body to deal with emergency situations. The major disorder of the adrenal medulla is pheochromocytoma, a neoplasm characterized by excessive catecholamine secretion.

**What is the correct medical term for deficient activity of the adrenal glands?** Adrenal insufficiency occurs when the adrenal glands don't make enough of the hormone cortisol. The primary kind is known as Addison's disease.

**How do you fix adrenal gland problems?** How to treat adrenal gland disorders depends on the specific condition. Some disorders require medications to increase your hormone levels. Your provider might suggest surgery or radiation therapy for conditions that involve tumors.

**What happens if your adrenal glands are bad?** With adrenal insufficiency, not being able to increase the amount of cortisol made as a result of stress can lead to an addisonian crisis. An addisonian crisis is a life-threatening situation that results in low blood pressure, low blood levels of sugar and high blood levels of potassium.

**What autoimmune disease affects the adrenal cortex?** Addison's disease can develop if your immune system attacks your adrenal glands and severely damages your adrenal cortex. When 90% of the adrenal cortex is destroyed, your adrenal glands will not be able to produce enough of the steroid hormones cortisol and aldosterone.

**What is a genetic disorder affecting the adrenal glands?** Congenital adrenal hyperplasia (CAH) describes a group of hereditary (inherited) genetic disorders affecting your adrenal glands. The two main types of CAH are classic and non-classic. Classic is diagnosed at birth, and nonclassic is typically diagnosed during adolescence.

**What does an adrenal gland do?** A small gland that makes steroid hormones, adrenaline, and noradrenaline. These hormones help control heart rate, blood pressure, and other important body functions. There are two adrenal glands, one on top of each kidney.

**Which disease is associated with the adrenal cortex?** The major disorders of the adrenal cortex (Table 21–1) are characterized by excessive or deficient secretion of each type of adrenocortical hormone: hypercortisolism (Cushing syndrome), adrenal insufficiency (Addison disease), hyperaldosteronism (aldosteronism), hypoaldosteronism, and androgen excess.

**What nerve supplies the adrenal glands?** The adrenal glands have a rich nerve supply. These nerves are derived from the coeliac plexus and the thoracic splanchnic nerves. The nerves supply the chromaffin cells of the medulla, but careful

microscopy has shown that nerve trunks and plexuses may also appear in the cortical layers.

**How does the adrenal medulla affect the body?** Your medulla secretes adrenaline in response to low blood sugar levels or exercise. It helps your body react to stress by: Delivering extra oxygen to muscles. Increasing blood pressure and heart output.

**What is impaired adrenal function?** Definition & Facts. Adrenal insufficiency, including Addison's disease, is a disorder that occurs when the adrenal glands don't make enough of certain hormones. These include cortisol, sometimes called the "stress hormone," which is essential for life.

**What is the first symptom of adrenal crisis?** What are the symptoms of an adrenal crisis? The most common symptoms of an adrenal crisis include: Abdominal pain or pain in your side (flank). Long-lasting fatigue.

**What are the symptoms of adrenal fatigue?**

**What is the most common cause of adrenal insufficiency?** Damage to the adrenal glands in Addison's disease is usually caused by autoimmune disease—when your immune system attacks your body's own cells and organs. In developed countries, autoimmune disease causes 8 or 9 of every 10 cases of Addison's disease.

**What triggers the adrenal glands?** The hypothalamus produces corticotropin-releasing hormone (CRH) that stimulates the pituitary gland to secrete adrenocorticotropin hormone (ACTH). ACTH then stimulates the adrenal glands to make and release cortisol hormones into the blood.

**What is the root cause of adrenal fatigue?** Our adrenal glands—small organs located above the kidneys—usually deal with stress by producing hormones like cortisol. According to the theory of adrenal fatigue, when people are faced with long-term stress, their adrenal glands cannot keep up with the body's need for these hormones.

**What depletes adrenal glands?** According to the theory, if you have long-term stress (like the death of a family member or a serious illness), your adrenal glands burn out from the prolonged production of cortisol. So adrenal fatigue sets in.
