**Understanding Ultrasound Physics, Fourth Edition by Sidney K. Edelman**

**Q: What is ultrasound?**

A: Ultrasound is a type of medical imaging that uses high-frequency sound waves to create images of the body's internal structures. The sound waves are emitted by a transducer, which is placed on the skin. The sound waves travel through the body and bounce off of different tissues and organs. The echoes are then received by the transducer and converted into an image.

**Q: What are the different types of ultrasound?**

A: There are two main types of ultrasound: Doppler ultrasound and B-mode ultrasound. Doppler ultrasound measures the velocity of blood flow in the body. B-mode ultrasound creates images of the body's tissues and organs.

It is often used to diagnose and monitor conditions such as heart disease, kidney disease, and cancer. Ultrasound can also be used to guide procedures such as biopsies and injections.
