## [Download Complete File](#)

**What is the confirmatory test used in forensics?** Gas chromatography/mass spectrometry (GC/MS) is the recommended confirmatory method."

**What is a presumptive drug test what is a confirmatory test?** Presumptive test panels can provide initial results that can be confirmed with definitive testing. Definitive drug testing is used to identify a specific drug that is inadequately detected by a presumptive test. Definitive drug testing is used to identify specific drugs or drug metabolites.

**What is the difference between confirmatory tests and preliminary tests?** Hence, positive results mean "maybe" and negative results mean "no". For this reason, a better name for this kind of test is "preliminary test". Confirmatory tests, by contrast, are slower, harder to perform, more expensive, less sensitive, but extremely specific.

**What is presumptive identification forensics?** "Presumptive" identifications are based on many other common sense factors including context, visual identification, tattoos, belongings, and clothing. Depending on the context of the case, a presumptive identification may suffice.

**What is a presumptive test in forensics?** A presumptive test is a qualitative analysis that allows to identify, or confirm, the presence of a substance in a sample. These determinations usually occur, after a chemical reaction, and a specific colour is produced. A false positive is another substance reacting the same way, producing the expected result.

**What are examples of presumptive blood tests?** Luminol, leuchomalachite green, phenolphthalein, Hemastix, Hemident, and Bluestar are all used as presumptive tests for blood.

**Why are presumptive and confirmatory tests important?** The purpose of a presumptive test for blood is to determine whether or not it is likely that this body fluid is present; in other words, a positive result indicates the possibility of blood. A positive result of a confirmatory test for blood allows one to conclude that blood is present. As Kobilinsky et al.

**What's the difference between a presumptive and confirmatory test quizlet?**  
Presumptive Test: This is done when tracing the presence of a particular substance.  
Confirmatory Test: This is done when the presumptive test show positive results. The purpose of this test is to confirm the identity, and the level or quantity of the substance in the body.

**What is the difference between presumptive and definitive drug tests?**  
Presumptive drug tests are used to detect the presence or absence of a drug or drug class; they do not typically indicate a specific level of drug but rather give a positive or negative result. A presumptive drug test may be followed with a definitive drug test in order to identify specific drugs or metabolites.

**What is confirmatory test with example?** Confirmatory test means a second analytical procedure to identify the presence in urine specimen of a specific drug or metabolite which is independent of initial test and which uses a different technique and chemical principle from that of the initial test in order to ensure reliability and accuracy.

**What are two types of confirmatory tests?** Phadebas Test and RSID Test for Human Saliva Performing both of these tests is considered a confirmatory test.

**Is luminol a confirmatory test?** In addition, because it can give false positive reactions, it is only a presumptive positive test for blood. Once areas are identified for luminol treatment the scene must be prepared, which requires the environment where it is used to be as dark as possible.

**Which is a presumptive test for a drug?** A microcrystalline test is a presumptive test in which there is a chemical reaction (precipitation reaction) between a substance and a reagent that yields a crystal formation that can be observed microscopically.

**What is the best definition of a presumptive identification?** Screening: The presumptive identification of unrecognized disease or defect by the application of test, examination, or other procedures which can be applied rapidly to asymptomatic population to sort out those who probably have the disease from those who probably not. (

**What is the confirmatory test used in forensic toxicology?** The confirmatory testing in forensic science is most often done by using mass spectrometry based methods. The mass spectrometry allows for determination of structure and identity of the drug and its metabolites.

**What is the difference between a presumptive and confirmatory diagnosis?** Screening or presumptive tests make use of a target chemical to establish the possibility that a specific body tissue or fluid is present. Confirmatory tests are then used to identify the specific biological material, which can then be typed.

**What are the steps for the presumptive test?**

**Why are confirmatory tests necessary?** Confirmation results that do not agree with the initial test results alert the laboratory to the possibility of a frame shift error so an investigation of the event can be initiated. The second purpose of confirmation testing is the use of a second (typically more specific) analytical methodology when available.

**What are the three presumptive tests?** This chapter provides an overview of various presumptive methods in forensic science and includes: colourimetric, immunoassay, and in-field testing.

**What are the forensic confirmatory tests for blood?** As discussed in the previous lesson, microcrystalline tests such as the Takayama test and the Teichmann test, are used to confirm the presence of blood. When certain reagents are added to the suspected area, crystals appear in case of blood stains which can be observed

through the microscope.

**What is a presumptive test used to identify?** Screening tests (also called color tests) are used to tentatively identify possible components of mixtures. They are similar to screening tests performed by police officers in the field.

**What is an example of a confirmatory test?** Confirmatory Tests The oldest is chemical confirmation of the presence of hemoglobin or its derivatives by the formation of specific crystals. For example, the Takayama or hemochromogen test, in which ferrous iron from hemoglobin reacts with pyridine to produce red feathery crystals of pyridine ferroprotoporphyrin.

**What are the four confirmatory tests?** The most common tests are oral sodium loading, saline infusion, fludrocortisone suppression, and Captopril challenge.

**Is luminol a confirmatory test?** In addition, because it can give false positive reactions, it is only a presumptive positive test for blood. Once areas are identified for luminol treatment the scene must be prepared, which requires the environment where it is used to be as dark as possible.

**What type of confirmatory test is used for blood?** As discussed in the previous lesson, microcrystalline tests such as the Takayama test and the Teichmann test, are used to confirm the presence of blood. When certain reagents are added to the suspected area, crystals appear in case of blood stains which can be observed through the microscope.
