Statistical Mechanics: Pathria Solutions Manual (Soucon)

Q1: Explain the concept of microstates and macrostates.

A1: A microstate is a complete description of the microscopic configuration of a system. A macrostate is a description of the system in terms of its macroscopic properties, such as temperature, pressure, and volume. The number of microstates that correspond to a given macrostate is the thermodynamic probability of that macrostate.

Q2: Derive the Boltzmann distribution for the number of particles in a given energy state.

A2: The Boltzmann distribution is given by:

$$n_i = e^{(-E_i/kBT)}$$

where:

- n_i is the number of particles in the i -th energy state
- E_i is the energy of the i -th energy state
- k is the Boltzmann constant
- T is the temperature

Q3: Explain the concept of entropy and its relation to the number of microstates.

A3: Entropy is a measure of the disorder of a system. The entropy of a system is proportional to the logarithm of the number of microstates that correspond to the

macrostate of the system. The greater the number of microstates, the greater the entropy.

Q4: Derive the thermodynamic relation between entropy, temperature, and heat capacity.

A4: The thermodynamic relation between entropy, temperature, and heat capacity is:

$$C_V = T(dS/dT)$$

where:

- C_V is the heat capacity at constant volume
- T is the temperature
- S is the entropy

Q5: Explain the concept of phase transitions and how they are described by statistical mechanics.

A5: A phase transition is a change in the physical properties of a system that occurs when the system is subjected to a change in temperature or pressure. Phase transitions can be described by statistical mechanics in terms of the changes in the number of microstates that correspond to the different phases of the system.
