#### The Cardiovascular System: 13a Lab Activity Q&A

**1. What is the purpose of the cardiovascular system?** Answer: The cardiovascular system is responsible for transporting blood throughout the body, delivering oxygen and nutrients to cells and removing waste products. It consists of the heart, blood vessels, and blood.

**2. What is the role of the heart?** Answer: The heart is a muscular organ that pumps blood through the body. It has four chambers: two atria and two ventricles. The atria receive blood from the body and the ventricles pump blood out to the body.

**3. What are the different types of blood vessels?** Answer: There are three main types of blood vessels: arteries, capillaries, and veins. Arteries carry oxygenated blood away from the heart to the body. Capillaries are the smallest blood vessels and allow for the exchange of gases and nutrients between the blood and the surrounding tissues. Veins carry deoxygenated blood back to the heart.

**4. What is blood pressure?** Answer: Blood pressure is the force exerted by the blood against the walls of the blood vessels. It is measured in millimeters of mercury (mmHg). Normal blood pressure is considered to be less than 120/80 mmHg.

**5. What are some factors that can affect the cardiovascular system?** Answer: Several factors can affect the cardiovascular system, including diet, exercise, smoking, and stress. A healthy diet, regular exercise, and avoiding smoking can help to maintain a healthy cardiovascular system. Stress can temporarily raise blood pressure and increase the risk of heart disease.

## **Wiley Fundamentals of Fluid Mechanics 7th Edition: Questions and Answers**

### **1. What is the difference between fluid statics and fluid dynamics?**

- Fluid statics deals with the behavior of fluids at rest, while fluid dynamics focuses on the behavior of fluids in motion.

### **2. What is the equation of continuity?**

- The equation of continuity states that the mass of fluid entering a control volume per unit time is equal to the mass of fluid leaving the control volume per unit time.

### **3. What are the types of fluid flow?**

- Fluid flows can be classified into laminar flow and turbulent flow. Laminar flow occurs when the fluid moves smoothly and in layers, while turbulent flow occurs when the fluid moves in a chaotic manner and has a high degree of mixing.

### **4. What is the Bernoulli equation?**

- The Bernoulli equation is an energy equation that relates the pressure, velocity, and elevation of a fluid in motion.

### **5. What are the applications of fluid mechanics?**

- Fluid mechanics has a wide range of applications in fields such as aerodynamics, hydraulics, and oceanography. It also plays a crucial role in the design of devices such as pumps, turbines, and aircraft.
