What were the conclusions drawn from Hill's reaction? He demonstrated that isolated chloroplasts would make oxygen (O₂) but not fix carbon dioxide (CO₂). This is evidence that the light and dark reactions occur at different sites within the cell. Hill's finding was that the origin of oxygen in photosynthesis is water (H₂O) not carbon dioxide (CO₂) as previously believed.

What was the chemical reaction discovered by Robert Hill? The Hill reaction is the portion of the light reactions in which electrons from water are transferred to an electron acceptor, reducing the acceptor.
