Which biologist gave the theory of evolution crossword puzzle clue? It was there that Charles Darwin began to really comprehend what causes evolution to occur.

What is the pattern of evolution where a species is stable for a long time then rapidly changes? But in 1972, evolutionary scientists Stephen Jay Gould and Niles Eldredge proposed another explanation, which they called "punctuated equilibrium." That is, species are generally stable, changing little for millions of years.

What principle states that living species are descended from ancient ones descent with? According to the principle of common descent, all species—living and extinct—are descended from ancient common ancestors. Common Descent implies that life has been on Earth for a very long time. Darwin suggested that the fossil record was evidence of descent with modification over long periods of time.

Had different shape beaks depending on the island they were from? On the Galapagos Islands, Darwin also saw several different types of finch, a different species on each island. He noticed that each finch species had a different type of beak, depending on the food available on its island. The finches that ate large nuts had strong beaks for breaking the nuts open.

Who discovered crossword puzzle? The first crossword was published on the 'Fun' page of The New York World on 21 December 1913. It was invented by British journalist Arthur Wynne, who emigrated to the United States in the 1890's.

Who solved evolution? Charles Darwin is commonly cited as the person who “discovered” evolution.

What is the theory that species evolve slowly and gradually over extended periods of time? Scientists think that species with a shorter evolution evolved mostly by punctuated equilibrium, and those with a longer evolution evolved mostly by gradualism. Gradualism is selection and variation that happens more gradually. Over a short period of time it is hard to notice.

What is a pattern of evolution in which new species arise rapidly and then remain unchanged for long periods of time termed? In the gradual speciation model, species diverge gradually over time in small steps. In the punctuated equilibrium model, a new species undergoes changes quickly from the parent species, and then remains largely unchanged for long periods of time afterward (Figure 18.3. 2).

Which theory states that species evolve quickly over a relatively short time? The theory of punctuated equilibrium states that evolutionary change is characterised by short periods of rapid evolution followed by longer periods of stasis in which no change occurs.

Who is the biologist of theory of evolution? According to the theory, some organisms contain traits and characteristics that are more suitable to the surrounding environment. Charles Darwin stated that these organisms were the ones to live longer and hence were able to reproduce to pass these desirable traits to their offspring.

What is the name of the biologist who put forward the theory of evolution? Charles Darwin. In 1859 Darwin published *On the Origin of Species*, which outlined his theory of evolution. was an English naturalist who studied variation in plants, animals and fossils during a five-year voyage around the world in the 19th century.

Which biologist is known for his theory of evolution and natural selection? Charles Darwin (born February 12, 1809, Shrewsbury, Shropshire, England—died April 19, 1882, Downe, Kent) was an English naturalist whose scientific theory of evolution by natural selection became the foundation of modern evolutionary studies.

Who is the father of evolution evolution? Charles Darwin: Naturalist, Revolutionary, and Father of Evolution.
