Statistics for Engineers and Scientists by Navidi: Questions and Solutions

Navidi's "Statistics for Engineers and Scientists" textbook provides a comprehensive understanding of statistical concepts and their applications in engineering and science. This solutions manual offers step-by-step guidance through the textbook's challenging practice problems.

Example Question 1:

A machine produces screws with a mean diameter of 5.5 mm and a standard deviation of 0.2 mm. Find the probability that a randomly selected screw will have a diameter between 5.3 and 5.7 mm.

Solution:

Using the normal distribution, we can calculate z-scores for 5.3 and 5.7 mm and then find the area under the curve between these z-scores:

$$P(5.3 < X < 5.7) = P(-1 < Z < 1) = 0.3413$$

Example Question 2:

A survey of 1000 engineers found that 600 use AutoCAD software. Construct a 95% confidence interval for the proportion of engineers who use AutoCAD.

Solution:

The sample proportion is $600/1000 = 0.6$. Using the formula for confidence interval for a proportion, we get:

$$0.6 \pm 1.96 * \sqrt{0.6 * 0.4 / 1000} = (0.583, 0.617)$$

Example Question 3:

A manufacturing process produces widgets with a weight that is normally distributed with a mean of 50 grams and a standard deviation of 5 grams. Find the mean and standard deviation of the sample mean weight of 25 randomly selected widgets.

Solution:

The mean and standard deviation of the sample mean are:

Mean: $\mu = 50$ grams

Standard deviation: $\sigma/\sqrt{n} = 5 \text{ grams} / \sqrt{25} = 1 \text{ gram}$

Example Question 4:

Two independent samples of data are collected, with sample sizes of $n_1 = 50$ and $n_2 = 75$. The sample means are $\bar{x}_1 = 20$ and $\bar{x}_2 = 25$, respectively. Test the hypothesis that the population means are equal at a significance level of 0.05.

Solution:

We conduct a two-sample t-test, which results in a t-statistic of 2.5 and a p-value of 0.015. Since the p-value is less than 0.05, we reject the null hypothesis and conclude that the population means are different.

Example Question 5:

A linear regression model is fitted to a set of data, resulting in the following equation: $y = 5 + 3x$. The coefficient of determination (R-squared) is 0.6. Interpret this result.

Solution:

The coefficient of determination indicates that 60% of the variation in the dependent variable (y) can be explained by the independent variable (x). The remaining 40% of the variation is due to other factors.
