What is a saturated and unsaturated solution answer? A saturated solution is a solution that contains the maximum amount of solute that is capable of dissolving. An unsaturated solution is a solution that contains less than the maximum amount of solute that is capable of being dissolved.

What feature in the graph can help you identify the saturated solutions explain? The lines on the solubility curve indicate a saturated solution - a solution that has the maximum amount of solute dissolved in 100 g of water. Any amount below the line for a particular substance shows an unsaturated solution, and anything above the line shows a supersaturated solution.

Is the liquid that drips from the filter unsaturated or saturated? Expert-Verified Answer Since the filtrate has passed through the filter paper, any undissolved solute particles have been removed, and the filtrate is a clear solution. This means the filtrate is likely to be a saturated solution, as the maximum amount of solute has been dissolved in the solvent.

When a small amount of additional solute is added to a saturated solution, what happens to the number of dissolved particles? When we add a small amount of solute to a saturated solution, the solute does not dissolve. The solute remains unchanged in the solution.

What is a saturated solution answers? A saturated solution is a solution that contains the maximum amount of solute that can be dissolved under the condition at which the solution exists.

How to know if saturated or unsaturated? To test whether a solution is saturated or unsaturated, we add more solute for example., sugar to the solution and stir it thoroughly. If the solute dissolves, the solution is unsaturated. If it remains undissolved, the solution is saturated.

How will you identify a saturated solution answer? How can you tell if a solution is saturated or unsaturated? If more solute is added and it does not dissolve, then the original solution was saturated. If the added solute dissolves, then the original solution was unsaturated.

What does unsaturated look like on a graph? The curved line represents saturation. Below the curve, the solution is unsaturated. Above the curve the solution is supersaturated. This means there is more solute than the solution can hold.

How do you identify the properties of saturated and unsaturated solutions? A saturated solution is one that contains the maximum amount of solute capable of being dissolved at a given temperature, whereas unsaturated solutions contain less than the maximum amount of solute capable of being dissolved at a given temperature.

How can you distinguish a Saturated from an unsaturated solution by just looking at the beaker? A saturated solution can be distinguished from an unsaturated solution by looking at the beaker and observing whether there is any undissolved solute at the bottom. If there is no solid solute present, it is likely to be a saturated solution.

What does Saturated mean in chemistry? Saturation is a physical or chemical situation where a system can take no more of a substance. Saturation occurs in

many different areas of science. Saturated solutions occur when there is the maximum concentration of solute in a solution.

What happens when you filter a saturated solution? The water in the filter paper will tend to dilute the saturated solution, decrease the remaining amount of undissolved solute on the filter paper when dried, and give an errant quantity of solute dissolved in the saturated solution which at this point is no longer saturated.

What happens when extra solute is added to saturated solution? What happens when you add more solute to a saturated solution? - Quora. You have a saturated solution . Simply this means that the solvent cannot dissolve more of the solute. Therefore : If you add more solute to the solution , the extra solute cannot be dissolved and it sinks to the bottom of the container.

What is the difference between solubility and dissolution? Dissolution is the process where a solute in a gaseous, liquid, or solid phase dissolves in a solvent to form a solution. [1][2][3] Solubility is the maximum concentration of a solute that can dissolve in a solvent at a given temperature. At the maximum solute concentration, the solution is said to be saturated.

How does evaporation change the concentration of a saturated solution? How does evaporation change the concentration of a saturated solution? Evaporation does not change the concentration of a saturated solution.

What is saturated and unsaturated? Saturated compounds- These compounds are organic compounds that have only one carbon to carbon single bond. Unsaturated compounds- These compounds are organic compounds that have double or triple carbon to carbon bonds.

What is saturated vs unsaturated simple? Unsaturated fats, which are liquid at room temperature, are different from saturated fats because they contain one or more double bonds and fewer hydrogen atoms on their carbon chains. Unsaturated fats come from plants and occur in the following kinds of foods: Olives. Olive oils.

What are saturated and unsaturated things?

What is the example of unsaturated solution and unsaturated solution? Any solution with a solute concentration below the saturation point is an unsaturated

solution example of such are the following: A pinch of salt dissolved in a cup of water. Mist, where water and air the solute and solvent respectively. Vinegar, where acetic acid and water are the solute and solvent, respectively.
