Zumdahl Chemistry 9th Edition Answers: Delving into Molecular Bonding

Question 1: Explain the difference between ionic and covalent bonding.

Answer: In ionic bonding, electrons are transferred from one atom to another, creating charged ions that attract each other. In covalent bonding, electrons are shared between atoms, forming a covalent bond.

Question 2: Describe the formation of a molecular orbital.

Answer: A molecular orbital is formed by the combination of atomic orbitals. When atomic orbitals overlap, they can merge to form molecular orbitals with higher or lower energy than the original atomic orbitals.

Question 3: What is the hybridization of the carbon atom in methane (CH₄)?

Answer: The carbon atom in methane is sp³ hybridized. This means that its four valence electrons are promoted to higher energy levels, resulting in four hybrid orbitals that point towards the corners of a tetrahedron.

Question 4: Explain the concept of resonance.

Answer: Resonance occurs when a molecule has multiple valid Lewis structures that differ in the arrangement of electrons. Each Lewis structure contributes to the overall bonding of the molecule.

Question 5: Describe the properties of polar molecules.

Answer: Polar molecules have a partial positive and negative end due to the uneven distribution of electrons. They are attracted to each other through dipole-dipole interactions, which can affect their solubility, boiling points, and other properties.
