Scaling and Root Planing: A Deeper Clean for a Healthier Smile

Q: What is scaling and root planing? A: Scaling and root planing is a dental procedure that involves removing plaque, tartar, and bacteria from the teeth and roots. It is typically used to treat gum disease, which can occur when plaque and tartar build up along the gum line.

Q: How does scaling and root planing work? A: Scaling and root planing is performed using ultrasonic or hand-held instruments to gently remove plaque and tartar from the teeth and roots. This helps to reduce inflammation and bleeding and create a healthy environment for the gums to heal.

Q: Why might I need scaling and root planing? A: Scaling and root planing may be recommended if you have gum disease, which can be indicated by symptoms such as bleeding gums, swollen gums, or receding gums. It can also be used to prevent gum disease in high-risk individuals.

Q: What should I expect during scaling and root planing? A: During the procedure, your dentist or hygienist will use a local anesthetic to numb the area being treated. The actual scaling and root planing process can take 30 minutes to 2 hours, depending on the severity of your gum disease. After the procedure, you may experience some discomfort or sensitivity, which can be managed with over-the-counter pain relievers.

Q: What are the benefits of scaling and root planing? A: Scaling and root planing can significantly improve gum health and prevent further damage to the gums and teeth. It can reduce inflammation, bleeding, and discomfort, and help preserve the health of your smile. Regular scaling and root planing is an essential part of maintaining good oral hygiene and overall dental well-being.
