[Download Complete File](#)

What is circulatory system question answer? The circulatory system delivers oxygen and nutrients to cells and takes away wastes. The heart pumps oxygenated and deoxygenated blood on different sides. The types of blood vessels include arteries, capillaries and veins.

How are the respiratory and circulatory systems connected answers? The respiratory system and circulatory system are connected at the alveoli and capillaries. Our respiratory system is made up of our airways and our lungs, allowing us to take in air that will travel into the lungs via the airways. The circulatory system is made up of the heart and blood vessels.

What do I know about respiratory and circulatory system answer? The circulatory system, which is made up of the heart and blood vessels, supports the respiratory system by bringing blood to and from the lungs. The circulatory system helps deliver nutrients and oxygen from the lungs to tissues and organs throughout the body. It also helps remove carbon dioxide and waste products.

How do the respiratory and circulatory systems work together choose 1 answer choose 1 answer? Answer and Explanation: The respiratory system works closely with the circulatory system for the transfer and transport of oxygen and carbon dioxide molecules. Every cell in our body needs oxygen to function properly. We bring oxygen into our body through the process of inhalation.

What is the circulation answer? The circulatory system (cardiovascular system) pumps blood from the heart to the lungs to get oxygen. The heart then sends oxygenated blood through arteries to the rest of the body. The veins carry oxygen-poor blood back to the heart to start the circulation process over.

What is the answer circulatory system? The circulatory system is made up of blood vessels that carry blood away from and towards the heart. Arteries carry blood away from the heart and veins carry blood back to the heart. The circulatory system carries oxygen, nutrients, and hormones to cells, and removes waste products, like carbon dioxide.

How do the respiratory and circulatory systems work together in Quizlet? How do the circulatory and respiratory system work together? The Respiratory System cleans and gets oxygen from outside your body, and then brings it to the lungs. Once in lungs, the circulatory system takes the oxygenated blood to other parts of your body.

Where do the respiratory and circulatory systems connect? Gas exchange occurs only in the alveoli. The alveoli are thin-walled and look like tiny bubbles within the sacs. The alveoli are in direct contact with capillaries of the circulatory system. Such intimate contact ensures that oxygen will diffuse from the alveoli into the blood.

What are the three parts of the circulatory system? The primary components in the circulatory system are the heart, the blood vessels, and the blood. - Blood is a fluid consisting of red blood cells, white blood cells, plasma, and platelets.

What is respiratory system answers? The respiratory system takes up oxygen from the air we breathe and expels the unwanted carbon dioxide. The main organ of the respiratory system is the lungs. Other respiratory organs include the nose, the trachea and the breathing muscles (the diaphragm and the intercostal muscles).

What organs are in the circulatory system? The cardiovascular system consists of the heart, veins, arteries, and capillaries. These components make up two circulatory systems: the systemic and pulmonary circulatory systems. The cardiac cycle consists of two phases: systole (relaxation) and diastole (contraction).

How does the circulatory system work? The blood circulatory system (cardiovascular system) delivers nutrients and oxygen to all cells in the body. It consists of the heart and the blood vessels running through the entire body. The arteries carry blood away from the heart; the veins carry it back to the heart.

How do the circulatory and respiratory systems work together to maintain homeostasis? The Respiratory system allows entry of oxygen into the body and release Carbon Dioxide. The Oxygen travels across lung tissue into blood vessels and the blood carries the oxygen around the body. Thus the Respiratory and Circulatory system work together in gas exchange which is vital in Homeostasis.

How does the respiratory system relate to cellular respiration? Respiration by the respiratory system supplies the oxygen needed by cells for aerobic cellular respiration and removes the carbon dioxide produced by cells during cellular respiration.

How do the circulatory and respiratory systems work together to remove carbon dioxide? At this point, the capillaries are packed with carbon dioxide, and the alveoli are full of oxygen. Oxygen and carbon dioxide pass through these capillaries into the air sacs. As oxygen crosses over into the capillaries, the red blood cells capture it, while the carbon dioxide is unloaded into the lungs to be removed.

What is the circulatory system very short answer? The system that contains the heart and the blood vessels and moves blood throughout the body. This system helps tissues get enough oxygen and nutrients, and it helps them get rid of waste products. The lymph system, which connects with the blood system, is often considered part of the circulatory system.

How does the circulatory system work with the respiratory system? Gas exchange between tissues and the blood is an essential function of the circulatory system. In humans, other mammals, and birds, blood absorbs oxygen and releases carbon dioxide in the lungs. Thus the circulatory and respiratory system, whose function is to obtain oxygen and discharge carbon dioxide, work in tandem.

In which organ does oxygen go into the blood? When we breathe in, the millions of air sacs in the lungs fill with fresh oxygenated air. The oxygen then moves into the

blood by passing first through the very thin walls of the air sacs and then into the capillaries, which are tiny blood vessels in a network within the lungs.

What is circulatory system one word answer? The circulatory system or cardiovascular system is a system in which blood circulates throughout the body. This organ includes blood, blood vessels, and the heart. The main function of this system is to provide oxygen, hormones to muscles, and nutrients throughout the body.

What does the circulatory system do select the best answer? The role of the circulatory system is to move nutrients, hormones, oxygen and other gases to your body's organs, muscles and tissues, to use for energy, growth and repair.

What is the circulation of blood answers? Blood comes into the right atrium from the body, moves into the right ventricle and is pushed into the pulmonary arteries in the lungs. After picking up oxygen, the blood travels back to the heart through the pulmonary veins into the left atrium, to the left ventricle and out to the body's tissues through the aorta.

What is the main function of the respiratory system? The lungs and respiratory system allow us to breathe. They bring oxygen into our bodies (called inspiration, or inhalation) and send carbon dioxide out (called expiration, or exhalation). This exchange of oxygen and carbon dioxide is called respiration.

What are the two passages that bring oxygen into your body? When you inhale through your nose or mouth, air travels down your pharynx (back of your throat), passes through your larynx (voice box) and into your trachea (windpipe). Your trachea is divided into two air passages called bronchial tubes. One bronchial tube leads to your left lung, the other to your right lung.

What respiratory structure controls breathing? The diaphragm: This dome-shaped muscle below your lungs separates the chest cavity from the abdominal cavity. The diaphragm is the main muscle used for breathing. The muscles between your ribs: Called intercostal muscles, these muscles play a role in breathing during physical activity.

What is the circulatory system explained? The circulatory system is made up of blood vessels that carry blood away from and towards the heart. Arteries carry blood away from the heart and veins carry blood back to the heart. The circulatory system carries oxygen, nutrients, and hormones to cells, and removes waste products, like carbon dioxide.

What are the 7 steps of blood flow through the heart? The path of blood flow through the heart takes the following route: blood flows from the vena cava to the right atrium, then through the tricuspid valve to the right ventricle, then through the pulmonary valve to the pulmonary artery, then onward to the lungs, the pulmonary veins, the left atrium, the mitral valve, the ...

How many parts are in the respiratory system? What Are the Parts of the Respiratory System? The respiratory system includes the nose, mouth, throat, voice box, windpipe, lungs, and diaphragm.

What carries blood to the heart? Arteries and veins link your heart to the rest of the circulatory system. Veins bring blood to your heart. Arteries take blood away from your heart.

What is the circulatory system and respiratory system? The respiratory system works with the circulatory system to provide this oxygen and to remove the waste products of metabolism. It also helps to regulate pH of the blood. Respiration is the sequence of events that results in the exchange of oxygen and carbon dioxide between the atmosphere and the body cells.
