Solution for Organic Chemistry by Paula Bruice

Q: What is the difference between structural and molecular formulas? A: A structural formula shows the arrangement of atoms in a molecule, while a molecular formula only gives the number of each type of atom in the molecule. For example, the structural formula of methane is CH_4 , while its molecular formula is also CH_4 .

Q: How do you determine the hybridization of a carbon atom? A: The hybridization of a carbon atom is determined by the number of bonds it forms. A carbon atom that forms four single bonds is sp^3 hybridized. A carbon atom that forms one double bond and two single bonds is sp^2 hybridized. A carbon atom that forms two double bonds is sp hybridized.

Q: What is the relationship between resonance and stability? A: Resonance is a phenomenon in which a molecule has two or more valid Lewis structures. Resonance stabilizes molecules by spreading out the electron density over multiple atoms. The more resonance structures a molecule has, the more stable it is.

Q: How do you predict the products of an organic reaction? A: To predict the products of an organic reaction, you need to know the mechanism of the reaction. The mechanism is a step-by-step description of how the reaction occurs. Once you know the mechanism, you can use it to predict the products of the reaction.

Q: What is the purpose of a reaction coordinate diagram? A: A reaction coordinate diagram is a graph that shows the energy changes that occur during a chemical reaction. The diagram shows the reactants, products, and transition state of the reaction. The transition state is the highest energy point on the diagram and represents the point at which the reactants are converted to products.
