Static Regain Method Duct Design: Questions and Answers

Q1: What is the static regain method of duct design?

A1: The static regain method is a technique used to estimate the static pressure loss in a duct system. It assumes that the total static pressure loss in a duct run is equal to the sum of the pressure losses due to friction, elbows, and other fittings. The pressure loss due to friction is calculated using Darcy's equation, while the pressure loss due to elbows and fittings is obtained from empirical correlations.

Q2: What are the advantages of using the static regain method?

A2: The static regain method is relatively simple to apply and requires minimal input data. It provides a reasonably accurate estimate of the static pressure loss in a duct system and can be used for both preliminary and final design calculations. Additionally, the method allows for easy adjustment of the duct size or configuration to meet specific design requirements.

Q3: What are the limitations of the static regain method?

A3: The static regain method is based on the assumption that the duct system is operating under steady-state conditions. It does not account for transient pressure changes or the effects of varying flow rates. Additionally, the method may not be accurate for complex duct systems with multiple branches or unusual geometries.

Q4: How is the static regain method used in designing duct systems?

A4: The static regain method is typically used as part of a larger duct design process. It is used to estimate the static pressure loss in each duct run, which is then used to calculate the fan power required to overcome the pressure loss. The duct size and configuration can be adjusted to meet the desired airflow rate and static pressure requirements.

Q5: What are some tips for using the static regain method effectively?

A5: To use the static regain method effectively, it is important to have accurate input data, including the duct dimensions, airflow rates, and fitting details. The method should be used as a guide rather than a precise calculation. It is recommended to consult with a qualified engineer or duct design software for complex or critical applications.

Static Problems Worksheet

This worksheet is designed to help students practice solving static problems. The problems involve objects that are at rest, and the forces acting on the objects are balanced.

Question 1: _____

A block of mass 10 kg is sitting on a table. The coefficient of static friction between the block and the table is 0.5. What is the maximum force that can be applied to the block before it starts to move?

Answer:

The maximum force that can be applied to the block before it starts to move is:

$$F = \mu mg = 0.5 * 10 \text{ kg} * 9.8 \text{ m/s}^2 = 49 \text{ N}$$

Question 2:

A ladder is leaning against a wall. The ladder is 5 m long and the angle between the ladder and the floor is 60 degrees. The coefficient of static friction between the ladder and the floor is 0.8. The ladder is supporting a person of mass 75 kg. What is the minimum normal force that the floor must exert on the ladder to prevent it from slipping?

Answer:

The minimum normal force that the floor must exert on the ladder to prevent it from slipping is:

$$N = mg * \cos(?) / ? = 75 \text{ kg} * 9.8 \text{ m/s}^2 * \cos(60^\circ) / 0.8 = 593.8 \text{ N}$$

Question 3:

A block of mass 5 kg is hanging from a rope. The rope is attached to a peg on the ceiling. The distance between the peg and the block is 2 m. What is the tension in the rope?

Answer:

The tension in the rope is:

$$T = mg = 5 \text{ kg} * 9.8 \text{ m/s}^2 = 49 \text{ N}$$

Question 4:

A car is traveling at a speed of 20 m/s. The car's mass is 1000 kg. The brakes are applied, and the car comes to a stop in a distance of 50 m. What is the average force of friction acting on the car?

Answer:

The average force of friction acting on the car is:

$$F = ma = 1000 \text{ kg} * 20 \text{ m/s} / 50 \text{ m} = 400 \text{ N}$$

Question 5:

A crate of mass 50 kg is sitting on a conveyor belt. The conveyor belt is moving at a speed of 2 m/s. The coefficient of static friction between the crate and the conveyor belt is 0.6. What is the minimum force that must be applied to the crate to prevent it from sliding?

Answer:

The minimum force that must be applied to the crate to prevent it from sliding is:

$$F = \mu mg = 0.6 * 50 \text{ kg} * 9.8 \text{ m/s}^2 = 294 \text{ N}$$
