**Understanding Semiconductors: Questions and Answers from Streetman's Solid State Electronic Devices, 6th Edition**

**1. What is the intrinsic carrier concentration in a semiconductor?** Answer: The intrinsic carrier concentration,  $n_i$ , is the concentration of electrons and holes in a semiconductor in thermal equilibrium at a given temperature. It is determined by the bandgap energy of the semiconductor.

**2. How does doping affect the conductivity of a semiconductor?** Answer: Doping introduces impurities into the semiconductor, which create either donor or acceptor levels within the bandgap. Donor impurities increase the concentration of

free electrons, while acceptor impurities increase the concentration of free holes, leading to an increase in conductivity.

**3. Explain the operation of a p-n junction.** Answer: A p-n junction is a semiconductor device formed by joining a p-type semiconductor with an n-type semiconductor. When forward biased, it allows current to flow due to majority carrier injection across the junction. When reverse biased, it blocks current flow due to the depletion region formed.

**4. What is the "turn-on" voltage of a p-n junction?** Answer: The "turn-on" voltage,  $V?$ , is the forward bias voltage at which significant current flow begins in a p-n junction. It is approximately equal to the sum of the built-in potential and the thermal voltage.

**5. How does the temperature affect the characteristics of a semiconductor?** Answer: Temperature has a significant impact on semiconductor properties. As temperature increases, the intrinsic carrier concentration increases, the mobility of carriers decreases, and the bandgap energy decreases. These effects influence the electrical and optical behavior of semiconductors.
