SCCM Interview Questions and Answers

Question 1: Describe the hierarchy and components of SCCM.

Answer: SCCM operates on a hierarchical structure, with the site server at the top level. Below the site server are primary and secondary sites, which manage clients in their respective domains. Components include the Configuration Manager console, which allows administrators to manage devices, the Site Database, which stores configuration information, and the Management Point, which distributes software and updates to clients.

Question 2: Explain the different deployment options for SCCM.

Answer: SCCM can be deployed as a standalone site or as part of a hierarchical structure. A standalone site is suitable for small organizations with a limited number of clients, while a hierarchical structure is more appropriate for larger organizations with complex network environments. Hierarchical structures allow for the management of multiple sites from a central location.

Question 3: Discuss the process of imaging a client device using SCCM.

Answer: Imaging involves capturing and applying a customized operating system image to a client device. In SCCM, this process involves creating an image template, capturing an image from a reference machine, and deploying the image to target devices. SCCM provides tools such as the Deployment Wizard and Task Sequences to streamline the imaging process.

Question 4: Describe the steps involved in creating a software package and deploying it to clients.

Answer: Creating a software package involves packaging the software files, specifying installation settings, and creating a deployment. SCCM offers various package types, such as standard packages, applications, and updates. Once created, the package can be deployed to target clients using the Deployment Wizard

or Task Sequences. SCCM tracks the progress of deployments and provides reporting capabilities.

Question 5: Explain how SCCM can be used for patch management.

Answer: SCCM simplifies patch management by automating the detection, approval, and installation of software updates. It allows administrators to create patch groups, configure automatic approval rules, and schedule patch deployments. SCCM provides comprehensive reporting on patch status, compliance, and any issues or errors encountered during deployment. By leveraging SCCM's patch management capabilities, organizations can enhance the security and stability of their IT infrastructure.
