What are options futures and other derivatives? Future and option are two derivative instruments where the traders buy or sell an underlying asset at a pre-determined price. The trader makes a profit if the price rises. In case, he has a buy position and if he has a sell position, a fall in price is beneficial for him.

What is future option swap? A swaption is a combination of a regular swap and an option. It gives a holder the right to enter a swap with another party at a given time in the future. Parties usually agree on a swaption when there are uncertainties about the price movements in the future.

What are examples of options derivatives? For example, suppose you purchase a call option for stock at a strike price of Rs 200 and the expiration date is in two

months. If within that period, the stock price rises to Rs 240, you can still buy the stock at Rs 200 due to the call option and then sell it to make a profit of Rs 240-200 = Rs 40.

Which is better, futures or options? The choice between futures and options depends on your investment goals and risk tolerance – Both instruments can be used for hedging, but options offer more flexibility and limited risk. Futures offer higher potential profits but also higher risk, while options provide limited profit potential with capped losses.

What is an example of a future option? Put Options on Futures Example You decide to buy a put option on gold futures with a strike price of \$1,500 per ounce that expires in December. The premium for this option is \$50 per ounce. Each futures contract represents 100 ounces, so you pay \$5,000 for the option (\$50 per ounce * 100 ounces).

What is the difference between a swap and a derivative? Derivatives are a contract between two or more parties with a value based on an underlying asset. Swaps are a type of derivative with a value based on cash flow, as opposed to a specific asset.

Why use swaps instead of futures? In this sense, swaps can be seen as a sequence, or strip, of futures (Heckinger and Mengle (2013)). One key difference between swaps and futures, however, is that futures are highly standardized contracts, while swaps can be customized to better hedge the price risk of the commodity for the counterparty.

What exactly are futures and options? Options grant investors the right, but not the obligation, to buy or sell assets at a predetermined price, while futures entail an obligation to buy or sell assets at a future date. These instruments serve as tools for investors to hedge existing positions or speculate on future price movements.

What are futures and derivatives? Futures are a type of derivative contract agreement to buy or sell a specific commodity asset or security at a set future date for a set price.

What are the different types of derivatives? The four types of derivatives are futures contracts, options contracts, forward contracts, and swaps. These financial instruments derive their value from an underlying asset and are used for hedging or risk management.

What is the difference between options and derivatives? A derivative is a financial contract that gets its value, risk, and basic term structure from an underlying asset. Options are one category of derivatives that give the holder the right, but not the obligation to buy or sell the underlying asset.
