Section 6: Introduction to Electronic Signals

Q1. What is an electronic signal?

A1. An electronic signal is a physical quantity that carries information. It can vary in amplitude, frequency, or phase to represent data or control functions.

Q2. What are the different types of electronic signals?

A2. Electronic signals can be classified based on their waveform. Common types include analog signals, which vary continuously, and digital signals, which take on discrete values.

Q3. What are the properties of electronic signals?

A3. Important properties include amplitude (strength), frequency (rate of oscillation), phase (time shift), and bandwidth (range of frequencies). These properties determine how a signal is received, processed, and transmitted.

Q4. What is signal processing?

A4. Signal processing involves manipulating electronic signals to extract, enhance, or transform information. This includes filtering, amplification, modulation, and other operations performed on analog and digital signals.

Q5. What is electronic communication?

A5. Electronic communication involves transmitting and receiving information over a physical medium, such as wires, fiber optics, or wireless channels. Electronic signals are the carriers of information in such systems.
