Welded Tubes EN 10217-7: Annealed vs. Not Annealed

Q: What does EN 10217-7 specify?

A: EN 10217-7 is a European standard that defines the technical delivery conditions for welded tubes made from non-alloy and fine grain steels. It covers requirements for chemical composition, mechanical properties, dimensions, and surface condition.

Q: What is the difference between annealed and not annealed tubes?

A: Annealing is a heat treatment process that involves heating the tubes to a specific temperature, holding them there for a period of time, and then slowly cooling them.

Annealing results in a softer and more ductile material. Not annealed tubes, also known as cold-worked tubes, have not undergone this process and are therefore harder and more brittle.

Q: Which type of tube is suitable for my application?

A: The choice between annealed and not annealed tubes depends on the specific requirements of the application. Annealed tubes are more suitable for applications where ductility and formability are important. Not annealed tubes are better suited for applications where strength and hardness are required.

Q: How do I identify annealed from not annealed tubes?

A: Annealed tubes have a smooth and shiny surface, while not annealed tubes have a rougher and more matte surface. Annealed tubes are also typically more flexible and easier to bend.

Q: Are there any other factors to consider?

A: In addition to the annealing status, other factors to consider when selecting welded tubes include the size, wall thickness, and grade of steel. It is important to consult with a qualified supplier to determine the best option for your specific needs.
