Like other powered industrial trucks, its purpose is to move, carry, push, pull, and lift a material load, then stack it or place it in a storage rack (tier).

How many truck lengths between forklifts? The safe traveling distance between forklifts is approximately three truck lengths, or about a time-lapse of three seconds when passing the same point. More specifically, it's about 20 feet between forklifts. The three-second rule is the same for automobiles on the road and is just as important for forklifts.

How high should a load be carried on a forklift? A properly trained operator will carry his forks or load 4-6 inches off the ground. This position is high enough to reduce contact with dock plates, expansion joints in concrete, uneven areas, slight slopes, inclines and debris on operating surfaces.

How to calculate forklift load capacity? How Is Forklift Capacity Calculated? To calculate X, multiply a forklift's rated capacity in pounds (A) by the distance in inches from the front wheel center line to the front of forks (B) plus its rated load center measured in inches (C). So, $X = A(B+C)$.

What is involved in a forklift test? Every forklift test involves a complete inspection of the forklift itself. You should be given an approved checklist of safety measures before even touching the lift itself. If you don't have this, don't start the test. Ask for a copy of the checklist and wait until you receive one to get into the forklift.

This creates a "safety halo" that consists of a two-ring zone – the danger zone and the warning zone. Danger Zone: This is the zone within three feet of a forklift. If a pedestrian is within three feet, the operator must stop.

What are 5 safety rules for a forklift?

What is a safe speed for a forklift? Instead, OSHA leaves it up to employers to determine a safe forklift speed. The Material Handling Equipment Distributors Association (MHEDA) “recommends a max speed of 8 mph in general and a 3 mph max speed in high pedestrian traffic areas.” A common forklift max speed is 10 miles per hour.

What is the 3m rule for forklifts? FORKLIFT SAFETY – 3 METRE EXCLUSION ZONE A three metre safe exclusion zone around forklifts must be enforced whilst they are operating. What should you do immediately after lifting a load? Nutrition, hydration, stretching and rest are key for enhancing muscle protein synthesis, recovery and minimizing the risk for injury. These four steps are simple, effective and essential for optimizing recovery after a big lift day.

Can a lift truck with a 5000 lb capacity at a 24 load center lift the following load? Since forklifts are rated at a load center, the further out you want to lift, the lower the capacity becomes. A 5,000 lb. capacity forklift will lift that much weight up to 48-inch forks (with a 24-inch load center) but going out to 60 inches (with a 30-inch load center), for example, drops the capacity to 4,000 lbs.
