in parallel with a resistor. Both circuits are used to represent a complex circuit with a single voltage or current source.

Q2: How do you find the Thévenin equivalent circuit of a given circuit?

A: To find the Thévenin equivalent circuit of a given circuit, you need to find the open-circuit voltage and the short-circuit current. The open-circuit voltage is the voltage across the terminals of the circuit when no current is flowing through the circuit. The short-circuit current is the current that flows through the circuit when the terminals of the circuit are shorted together.

Q3: How do you find the Norton equivalent circuit of a given circuit?

A: To find the Norton equivalent circuit of a given circuit, you need to find the short-circuit current and the open-circuit voltage. The short-circuit current is the current that flows through the circuit when the terminals of the circuit are shorted together. The open-circuit voltage is the voltage across the terminals of the circuit when no current is flowing through the circuit.

Q4: What is the maximum power transfer theorem?

A: The maximum power transfer theorem states that the maximum power is transferred from a source to a load when the load resistance is equal to the source resistance.

Q5: What is the superposition theorem?

A: The superposition theorem states that the response of a linear circuit to multiple sources is the sum of the responses of the circuit to each source acting alone.
