**Textile Preparation and Dyeing: A Comprehensive Guide**

**Q: What is textile preparation?** A: Textile preparation encompasses a series of processes that prepare fabrics for dyeing and finishing by removing impurities, ensuring uniformity, and enhancing their receptiveness to dyes. It includes operations like scouring, bleaching, mercerizing, and singeing.

**Q: Why is scouring necessary?** A: Scouring removes dirt, grease, waxes, and other contaminants from fabrics. These impurities interfere with dyeing by preventing dyes from penetrating the fibers evenly. Scouring agents, such as alkalis or surfactants, are used to dissolve and remove these substances.

**Q: What is the purpose of bleaching?** A: Bleaching lightens the color of fabrics by removing natural pigments. It also improves their brightness and whiteness, making them more receptive to dyes. Bleaching agents, such as hydrogen peroxide or sodium hypochlorite, are used to oxidize and break down these pigments.

**Q: How does mercerization enhance fabrics?** A: Mercerization strengthens and imparts a silky luster to fabrics. It involves treating them with a strong alkaline solution under tension, causing the fibers to swell and rearrange, resulting in increased tensile strength, luster, and dye affinity.

**Q: What is singeing and why is it used?** A: Singeing is a process that removes protruding fibers from the surface of fabrics using a gas flame or hot blade. This smooths the fabric, reduces pilling, and improves its overall appearance. It is particularly useful for fabrics made from natural fibers, such as cotton or linen.
