NEW EDITION

[Download Complete File](#)

Where does Dr Goljan teach? Edward Goljan, M.D. (also known as "Poppie"), is a Curriculum Coordinator, Professor of Pathology, and former Chair of Pathology at Oklahoma State University Center for Health Sciences, an osteopathic medical school in Oklahoma.

Which is better, Pathoma or Goljan? Hands down it is Goljan Pathology if you have time and patience, you will never find a book better than this; it will prepare you not only for examination but also for being a better doctor. If you have less time and want all high yield matter to read, go for Pathoma book along with his video lectures.

Did Goljan have ALS? Goljan claims a couple times that he was cured of ALS on his step 1 audio. The second time he mentioned it he says that his hand muscles are still atrophied (**** off if I didn't use the right word) as a reminder of his illness. I think he said some minister prayed over him that healed him.

The Renal System at a Glance

What is the renal system?

The renal system, also known as the urinary system, is a complex network of organs and structures that work together to eliminate waste products from the body and regulate blood composition.

What are the main organs of the renal system?

The main organs of the renal system include:

- **Kidneys:** Filter blood to remove waste products and excess fluid, producing urine.
- **Ureters:** Tubes that transport urine from the kidneys to the bladder.
- **Bladder:** Stores urine until it is released through urination.
- **Urethra:** Tube through which urine exits the body.

What is the function of the kidneys?

The kidneys perform several essential functions, including:

- Filtering waste products, such as urea, creatinine, and toxins, from the blood
- Regulating blood volume and electrolyte balance
- Maintaining the proper pH level in the blood
- Producing hormones, such as erythropoietin and renin

How does urine form?

Urine formation occurs in the following steps:

1. **Filtration:** Blood is filtered through tiny structures called glomeruli in the kidneys, removing waste products and excess fluid.
2. **Reabsorption:** Essential substances, such as glucose, amino acids, and electrolytes, are reabsorbed back into the bloodstream in the renal tubules.
3. **Secretion:** Certain substances, including medications and toxins, are actively secreted from the bloodstream into the renal tubules.

4. **Collection:** The filtered fluid, now containing waste products and toxins, flows through the renal tubules and collecting ducts to form urine.

What can affect the function of the renal system?

Various factors can affect the function of the renal system, including:

- **Age:** Kidney function typically declines with age.
- **Chronic diseases:** Conditions such as diabetes, hypertension, and kidney stones can damage the kidneys.
- **Medications:** Certain medications, including nonsteroidal anti-inflammatory drugs (NSAIDs) and antibiotics, can impair kidney function.
- **Lifestyle factors:** Poor diet, smoking, and lack of exercise can contribute to kidney disease.
