Trip Generation: 9th Edition

The Institute of Transportation Engineers (ITE) publishes the Trip Generation Manual, which provides guidance on estimating trip generation rates for various land uses. The 9th edition of the manual was released in 2017.

What is trip generation? Trip generation is the process of estimating the number of trips that will be generated by a specific land use. This information is used to determine the transportation infrastructure needed to accommodate the development.

How is trip generation estimated? Trip generation rates are typically estimated using regression analysis. This involves collecting data on the number of trips generated by similar land uses and then developing a mathematical model that can predict the number of trips that will be generated by a new development.

What are some factors that affect trip generation? The factors that affect trip generation include:

- Land use type
- Size of the development
- Location of the development
- Time of day
- Day of week

How is the Trip Generation Manual used? The Trip Generation Manual is used by transportation planners, engineers, and other professionals to estimate the number of trips that will be generated by a specific land use. This information is then used to design transportation infrastructure, such as roads, highways, and public transit systems.

What is new in the 9th edition of the Trip Generation Manual? The 9th edition of the Trip Generation Manual contains several new features, including:

- Updated trip generation rates for all land use types
- New trip generation models for emerging land uses, such as micro-apartments and co-working spaces
- Improved guidance on estimating trip generation for mixed-use developments
- A new online tool that allows users to estimate trip generation rates for specific land uses
