What is the difference between Hornady 124 P and 135 P? My personal favorite Hornady Critical Duty option is the +P 124-grain bullet weight. This round packs on an extra 10% muzzle velocity and over 20% extra muzzle energy compared to its 135-grain brother.

Does the FBI use Hornady ammo? To answer the question, Hornady Critical Duty 9mm+P 135 gr FTX is what the FBI is currently using, but that could change based on the following information. Keep reading!

Which Hornady bullet is best for deer? Hornady SST bullets are best used for hunting medium to large-sized game animals. These bullets are perfect for whitetail deer hunting, feral hogs, and pronghorn, as they are extremely accurate and create massive wound channels on thin-skinned game.

What is Hornady Amax for? Hornady A-MAX bullets use a secant ogive geometric profile, which reduces drag and leads to very flat trajectories over a very long range. This shape also ensures stability while giving the bullet the highest level of ballistic coefficient available.

Which is better 115 grain or 124? Both 115 grain and 124 grain 9mm ammunition can serve effectively for self-defense purposes. The 124 grain round might have a slight edge in terms of terminal performance due to its higher muzzle energy, but the 115 grain round remains widely used and trusted by law enforcement and civilians alike.

What does P mean on ammo? Overpressure ammunition, commonly designated as +P or +P+ (pronounced Plus-P or Plus-P-Plus), is small arms ammunition that has been loaded to produce a higher internal pressure when fired than is standard for ammunition of its caliber (see internal ballistics), but less than the pressures

generated by a proof round.

Is 124 grain 9mm good for range shooting? Ultimately, if you're just training at the range, the differences between 115 grain and 124 grain 9mm rounds are negligible. Our recommendation is to find a round that works well for you and your gun, and stock up so that you're always ready for a range day!

What ammo is most wanted in USA?

What do red tip 9mm bullets do? Military ammo with a red tip indicates tracer ammunition. Tracer bullets have a hollow base that is filled with magnesium. The flash from the propellant ignites this flammable metal which burns and becomes brightly visible in flight.

What 9mm grain do police use? The Federal Bureau of Investigation (FBI) completed an extensive evaluation process and chose Hornady Critical Duty® 9mm+P 135 gr FTX pistol ammunition as its contracted service ammunition. The patented Hornady® Flex Tip® design of the FlexLock® bullet eliminates clogging and aids bullet expansion.

What is the best caliber for deer under 100 yards? As you can see, the 243 Winchester, according to the KPS scale, is best suited for medium size deer out to just under 100 yards. Further than that, you're looking at the smaller deer species. The adjusted maximum point-blank range is 275 yards.

What caliber has killed the most deer? Legend has it the .30-30 Winchester has felled more whitetails than any other cartridge.

What does SST stand for in Hornady bullets? The Hornady® SST® (Super Shock Tip) is designed to deliver tremendous shock on impact while expanding quickly and reliably, particularly at higher velocities.

What does FTX stand for in Hornady bullets? Flex Tip technology is the name Hornady has given to the bullet design in their FTX line of ammunition. This ammo line covers a wide range of calibers and name brands, and is a replacement for the old hollow points used for home defense and concealed carry weapons.

What does GMX stand for in Hornady bullets? The new Hornady bullet is called the "Gilding Metal eXpanding" (GMX), which gives a clue to what monolithic metal is used. Gilding metal is the same material most jacketed bullets use to wrap the lead core, an alloy composed of 95 percent copper and 5 percent zinc.

What is Hornady black for? The Hornady Black 5.56 NATO 75-grain Interlock HD SBR bullet is designed specifically for rifles using a 10.5" to 11.5" barrel length. Ideal for both suppressed and unsuppressed fire, this load works to minimize muzzle flash and barrel residue typically seen in short barrel rifles (SBR).

What is phytoplankton and ocean productivity? What is Ocean Productivity? Ocean productivity largely refers to the production of organic matter by "phytoplankton," plants suspended in the ocean, most of which are single-celled.

Where in the ocean is plankton productivity the greatest? Phytoplankton productivity is typically the highest at the ocean surface. Phytoplankton require sunlight to produce their food/energy. Therefore, phytoplankton must be located near the ocean's surface in order to be able to absorb sunlight. Without sunlight, most phytoplankton are unable to produce much food/energy.

Which is known to limit phytoplankton productivity in the open ocean? They also require trace amounts of iron which limits phytoplankton growth in large areas of the ocean because iron concentrations are very low. Other factors influence phytoplankton growth rates, including water temperature and salinity, water depth, wind, and what kinds of predators are grazing on them.

What is the primary productivity of phytoplankton? Primary productivity may be defined as the amount of organic material produced per unit area per unit time; or simply as the product of phytoplankton biomass times phytoplankton growth rate (Cloern and others, 2014).

What happens if there is too much phytoplankton in the ocean? When there is too much plankton due to excess nutrients in the water (known as eutrophication), harmful algal blooms can result. These can decrease the sunlight and oxygen in the water, which can disrupt the natural ecosystem.

Why is phytoplankton important to the ocean? Phytoplankton is the base of several aquatic food webs. In a balanced ecosystem, they provide food for a wide range of sea creatures. Phytoplankton, also known as microalgae, are similar to terrestrial plants in that they contain chlorophyll and require sunlight in order to live and grow.

What does phytoplankton eat? Phytoplankton are mostly microscopic, single-celled photosynthetic organisms that live suspended in water. Like land plants, they take up carbon dioxide, make carbohydrates using light energy, and release oxygen.

What is phytoplankton good for? Phytoplankton are microscopic plants floating around in marine and aquatic ecosystems that produce 50-80% of the world's oxygen. Besides providing food for countless other organisms, they are so effective at absorbing carbon dioxide that some have suggested growing phytoplankton as a solution to climate change.

What is the difference between plankton and phytoplankton? Phytoplanktons and zooplanktons are two types of planktons that are found in water. Phytoplanktons are plants, while zooplanktons are animals; this is the main difference between them.

What are the predators of phytoplankton? Phytoplankton and algae form the bases of aquatic food webs. They are eaten by primary consumers like zooplankton, small fish, and crustaceans. Primary consumers are in turn eaten by fish, small sharks, corals, and baleen whales.

During which season is phytoplankton production the highest? During summer, productivity is at its highest, but is reliant on recycled nutrients within the water column by smaller phytoplankton species (i.e. the microbial loop).

How to increase phytoplankton? The two most important nutrients for phytoplankton growth are the elements nitrogen (N) and phosphorus (P), which are found naturally in aquatic environments in various concentrations. Iron, zinc and manganese are also essential, but they are needed only in very small quantities.

What is the highest primary productivity in the ocean? Global averages for ocean surface primary production are about 75-150 g C/m²/yr. Some highly productive areas include the California coast (200-300 g C/m²/year), the Southern

Ocean (200-400 g C/m²/year), and the coast of Peru (200-400 g C/m²/year), all regions with significant upwelling.

What are the factors affecting plankton productivity? Nitrogen uptake rates of phytoplankton are influenced by a number of factors such as light, temperature, available nitrogen sources, iron concentrations, and competition from bacteria.

Which factors can limit phytoplankton productivity? CO₂ usually does not limit phytoplankton growth due to its high concentration in seawater. However, the vast majority of oceanic surface waters are depleted in inorganic nitrogen, phosphorus, iron and/or silica; nutrients that limit primary production in the ocean (Figure 1).

What destroys phytoplankton? Infections by viruses, fungi, bacteria, and protists can also contribute substantially to phytoplankton mortality. High cell densities of a single-species bloom favor the spread of infections during blooms, and can result in rapid bloom termination.

Is plankton harmful to humans? Most phytoplankton are harmless to animals. However, a few species can produce toxic, or poisonous, chemicals. Some dinoflagellates and diatoms can make poisonous compounds that cause diarrhea, paralysis, dizziness, and even memory loss.

What is the biggest threat to plankton? Warming may cause other, less palatable, species to replace them, depriving zooplankton and menhaden of their primary food source. Because phytoplankton are linked to freshwater and nutrient inputs, draught will likely decrease their abundance.

What produces the most oxygen on Earth? Though they're invisible to the naked eye, they produce more oxygen than the largest redwoods. Scientists estimate that roughly half of the oxygen production on Earth comes from the ocean. The majority of this production is from oceanic plankton — drifting plants, algae, and some bacteria that can photosynthesize.

What creature is plankton? Plankton are marine drifters — organisms carried along by tides and currents. The word “plankton” comes from the Greek for “drifter” or “wanderer.” An organism is considered plankton if it is carried by tides and currents, and cannot swim well enough to move against these forces.

What would happen if plankton didn't exist? If plankton numbers were to decline as drastically as 90%, there would be a significant reduction in atmospheric oxygen. Further, plankton are a major carbon sink. Through photosynthesis, phytoplankton consume carbon dioxide on a scale equivalent to forests and other land plants.

What is the global relationship between phytoplankton diversity and productivity in the ocean? Primary production and phytoplankton diversity show a large degree of spatial correlation, with diversity tending to be higher where productivity is high and lower when productivity is low (see Fig.

What is the role of phytoplankton in the ocean's biological pump? When phytoplankton die or are eaten by zooplankton, the carbon-rich fragments sink deeper into the ocean, where it is, in turn, eaten by other creatures or buried in sediments. This process is key to the “biological carbon pump,” an important part of the global carbon cycle.

What is phytoplankton production? Paralleling plants on land, phytoplankton undertake primary production in water, creating organic compounds from carbon dioxide dissolved in the water. Phytoplankton form the base of — and sustain — the aquatic food web, and are crucial players in the Earth's carbon cycle.

What determines ocean productivity? The Biological Productivity Of the Ocean - Key takeaways Primary productivity is limited by nutrient and light availability. Colder, nutrient-rich waters are trapped below warmer, sunlit water. Open ocean has a low rate of productivity, compared to coastal zones and areas near upwellings.

The Invention of the Restaurant in Paris and the Birth of Modern Gastronomic Culture

Question: When and where did the first restaurant open? Answer: The first restaurant, in the modern sense of the term, opened in Paris in 1765 by a man named Boulanger. Boulanger offered a variety of hot and cold dishes, as well as wine and coffee, to his customers.

Question: What were the factors that led to the invention of the restaurant? Answer: The invention of the restaurant was a product of several factors, including the growing population of Paris, the increasing popularity of coffeehouses, and the

emergence of a new class of wealthy diners.

Question: How did the restaurant influence modern gastronomic culture?

Answer: The restaurant played a pivotal role in the development of modern gastronomic culture. By providing a space for people to eat out, it encouraged the creation of new dishes and the refinement of cooking techniques. The restaurant also helped to spread the knowledge of French cuisine around the world.

Question: What were some of the most famous restaurants in early Paris?

Answer: Some of the most famous restaurants in early Paris included the Tour d'Argent, the Grand Véfour, and the Café de Paris. These restaurants were known for their exquisite food and service, and they attracted a clientele of wealthy diners and celebrities.

Question: How has the restaurant industry evolved over the centuries?

Answer: The restaurant industry has evolved dramatically over the centuries. Today, restaurants are found in every corner of the globe, and they offer a wide variety of cuisines to suit every taste. The restaurant industry has also become a major economic force, employing millions of people worldwide.
