**How does pipeline pigging work?** Intelligent pigs are used to inspect the pipeline with sensors and record the data for later analysis. These pigs use technologies such as magnetic flux leakage (MFL) and ultrasound to inspect the pipeline. Intelligent pigs may also use calipers to measure the inside geometry of the pipeline.

**What is pigging technology?** "Pigging" is a process in which highly viscous fluids are conveyed out of pipelines. The pig is a cleaning device that is pumped through the pipeline under pressure. Thus, contaminations are conveyed out of the piping. In

the oil and gas industry, usually pipelines with large diameters are in use.

**What is the principle of pigging?** The basic principle is that a pressure drop is created over a by-passable pig held back against a pipeline's fluid flow. The pipeline fluid passing through the pigs cleaning head is accelerated by this pressure drop, forming strong cleaning jets.

**What is standard for pipeline pigging?** Length – Overall pig length should generally be 1.5 – 2 times the pipe's nominal size. With a length of less than 1.5 times the nominal size, the pig may roll in the pipeline. Spacing between the extreme pig supports should therefore be no less than 1.1 times the pipe diameter.

**How often should a pipeline be pigged?** Frequency should be based on the particular need of the line. As a rule of thumb, the closer to production the line is, the more need there is for pigging. For example, crude oil lines that have potential for wax build up or known build up are often pigged weekly.

**What are the dangers of pigging?** During a pigging operation, workers are at risk of exposure to toxic chemicals, oxygen deficient environments and flammable materials. If appropriate procedures and practices are not followed workers may also be at risk of being struck by equipment propelled by high pressure gases.

**How fast are pigs in the pipeline?** In gas pipelines, pigging operations typically take place under normal operating pressures, and during these operations, the pigs typically travel at speeds ranging from 2 to 5 meters per second (m/s).

**What material is used for pigging pipes?** Utility PIGs also referred to as Mechanical PIGs are used for pipeline cleaning and gauging and can be made from a range of materials including carbon steel, foam, and Plastics.

**Why is it called pigging?** As the crude device went through the pipe, (whether it was the straw-and-wire device or the one with metal discs) it was reported to have made a squealing noise, which sounded a bit like a squealing pig. And so the term 'pigging' was born!

**What are the different types of pigging?** The primary types of pipeline pigging include cleaning pigs, batching pigs, and inspection pigs. Cleaning pigs: Cleaning pigs are designed to remove debris, sediment, and deposits that accumulate in

pipelines over time. Nivalis's innovative Ice Pigging technique uses ice as the "pig".

**What valves for pigging?** One of the most common valves that are piggable is Trunnion Mounted Ball Valves, also known as Shut-Off Pigging Valves. These are piggable due to their launching and receiving pig design, or otherwise known as an entry and exit point.

**What is the flow rate of pigging?**

**What is the process of pipeline pigging?** Pigging involves inserting a device (i.e., a pig) into a launcher upstream of the pipeline segment where condensates have accumulated. Pigs are typically made of materials such as plastic, urethane foams, and rubber.

**Why is a pipeline tool called a pig?** Early pigs were made from materials such as straw, barbed wire and leather and made a squealing sound while traveling through the pipes – for this reason, they were eventually called “pigs”. The name eventually became an acronym for “Pipeline Inspection Gauge” or “Pipeline Intervention Gauge”.

**What are the benefits of pipeline pigging?**

**How long does pigging take?** Most pigging operations last just a few seconds, sometimes even fractions of a second. This makes the whole pigging process extremely quick, minimising interruption to operations.

**What is the mega rule for gas pipelines?** The PHMSA Mega Rule, a set of regulations passed to enhance pipeline safety and reduce pipeline failures, was implemented in three parts over the past decade. PHMSA issued the Mega Rule in response to a number of incidents that highlighted the need for improved pipeline regulations.

**How much does a mile of pipeline cost?** A survey by BTU analytics of 9 gas pipelines in the U.S. Northeast found a range of \$5.5 million - \$13.14 million per mile, with a median of \$8.45 million/mile, or \$5.25 million/km. The pipelines were onshore and ranged from 118 to 600 miles length. The pipelines were built from 2017 to 2020.

**What is pig waste called?** Pig waste is a by-product of swine farming, consisting of solid and liquid components. Pig waste is called manure when it includes undigested food and bedding material in its solid form. The liquid fraction, commonly known as pig slurry, contains urine and water used for cleaning.

**What do pig farms do with pig waste?** Those troughs are periodically flushed into an earthen hole in the ground called a “lagoon”—which contain a mixture of water, pig excrement, pig carcasses and anaerobic bacteria. The bacteria digest the slurry and also give lagoons their pink coloration.

**What is bypass pigging?** Hefei General Machinery Research Institute. International Journal of Fluid Engineering. Bypass pigging is a promising strategy to improve pipeline flow assurance by eliminating pigging-generated slugs and reducing pig velocity.

**How do you start a pig in a pipeline?** Launching a pipeline pig: Leaving the valves open, allow it to drain completely (0 psi), and then open the closure door. Now, install the pipeline pig, allowing firm contact between the reducer, which is situated between the nominal bore section of the launcher and the barrel.

**How fast are pigs in the pipeline?** In gas pipelines, pigging operations typically take place under normal operating pressures, and during these operations, the pigs typically travel at speeds ranging from 2 to 5 meters per second (m/s).

**How do you get a pig unstuck from a pipeline?** Increase the flow rate and line pressure, but do not exceed safe limits of the pipeline. 2. Remove pressure from the line and vent or drain toward the launcher. Removing pressure allows the pig to relax to its original shape and may cause it to back up in the pipeline.

**How do you track a pig in the pipeline?** HPS pig detectors mount externally on the pipe being pigged. To track the pig, when a pig passes the detector, the detector picks up the pigs magnetic field. To provide a visual indication to the operator, an LED on the detector lights as the pig travels past.
