Section 7.1: Image Optimization and Post-Processing

Q1: What is the purpose of image optimization in ultrasound imaging?

A1: Image optimization enhances the quality of ultrasound images by reducing noise, improving contrast, and increasing visibility of anatomical structures. It allows for more accurate interpretation and diagnosis.

Q2: What are the key image optimization parameters in the SIUI CTS 900 Digital Ultrasound Imaging System?

A2: The key parameters include Brightness, Contrast, Gain, Sharpness, and Dynamic Range. These parameters fine-tune the image to improve its overall presentation.

Q3: What post-processing modes are available in the SIUI CTS 900?

A3: The SIUI CTS 900 offers a range of post-processing modes, including Edge Enhancement, Speckle Reduction, and Harmonic Imaging. These modes enhance specific aspects of the image for improved visualization.

Q4: How can Harmonic Imaging improve image quality?

A4: Harmonic Imaging isolates and displays the higher-frequency harmonics of the ultrasound signal, which are less attenuated and produce images with improved

resolution and reduced noise.

Q5: What additional tools are available for post-processing in the SIUI CTS 900?

A5: The SIUI CTS 900 provides advanced tools such as Doppler Flow Imaging, Speckle Tracking, and 3D Rendering. These tools enable clinicians to perform more detailed analysis and enhance diagnostic capabilities.
